Dear Mr. Giese:

Enclosed is a summary of the water quality, biological and sediment data collected from Upper Des Lacs lake during the summer of 1997 and winter 1998. Due to time constraints, this document has more function and less flash than I originally envisioned. If you have any questions or comments, please contact me at the address above or by calling (701) 328-5268.

Sincerely,

Peter Wax

Acknowledgments

Numerous scientists and technicians have made major contributions to the Lake Water Quality Assessment Project. Funds were provided through a grant from the United States Environmental Protection Agency. Appreciation is extended to the North Dakota Department of Health's, Division of Chemistry for their accurate analysis of all samples, to Eric Hoggarth, Jon Long, and Seth Stroup for sample collection, and data entry, and lastly to Dan Severson and Fred Giese for allowing us access to the refuge.

Introduction

This is a summary of the data collected on Upper Des Lacs Lake as part of the State's Lake Water Quality Assessment Project. The Project is designed to characterize the Upper Des Lacs lake's baseline chemical, physical, and biological condition. The assessment is not intended to pinpoint sources or causes of lake condition and lacks the intensity to do so. Data was collected from Upper Des Lacs Lake at 2 location (Figure 1) and on 4 discrete dates (May 21, August 12, September 7, 1997, and February 23, 1998).

The Upper Des Lacs Lake is located in North Central North Dakota near the town of Kenmare in Ward and Burke Counties. It is a U.S. Fish and Wildlife Service (USFW) dam built for water supply, wildlife propagation, and waterfowl staging and resting. Nearly all of the reservoir lies within the boundary of the Des Lacs National Wildlife Refuge (NWR) with a small portion extending into Saskatchewan Canada.

Upper Des Lacs Lake is one of three man-made reservoirs in the NWR. The lake is long and narrow with a surface area 4,292 acres and a maximum depth of 14 feet. Upper Des Lacs Lake's drainage area is approximately 597 square miles of which 365 lie in North Dakota and the remaining 232 in Saskatchewan Canada. A significant amount of the Upper Des Lacs watershed is composed of noncontributing terminal drainages typical of the prairie pot hole region of the Northern Glaciated Plains.

Due to it's shallow depth and frequent fish kills, the North Dakota Department of Health (NDDH) does not classify the Upper Des Lacs Lake as a fishery, however, there is most likely a permanent or semi-permanent population of small species such as shiners, minnows, white suckers and bullheads. During periods of high water the Upper Des Lacs Lake sustains temporary populations of northern pike and yellow perch.

Public facilities on the Upper Des Lacs Lake include 1 lake access points with day use picnic area, auto routes, and hiking trails. Boating and refuge access are controlled by the NWR with restrictive operational times and seasons. For information on restrictions and recreational opportunities contact the NWR head quarters.

Water Quality

Lake water quality assessment data was collected on Upper Des Lacs Lake during the summer of 1997 and winter of 1997-98. Data collected included water quality chemistry (Table 2), phytoplankton species identification and population enumeration, and sediment analysis. The data will be used to evaluate Upper Des Lacs Lake's physical, chemical, and biological condition over the sampling period of May 21, 1997 through February 24, 1998.

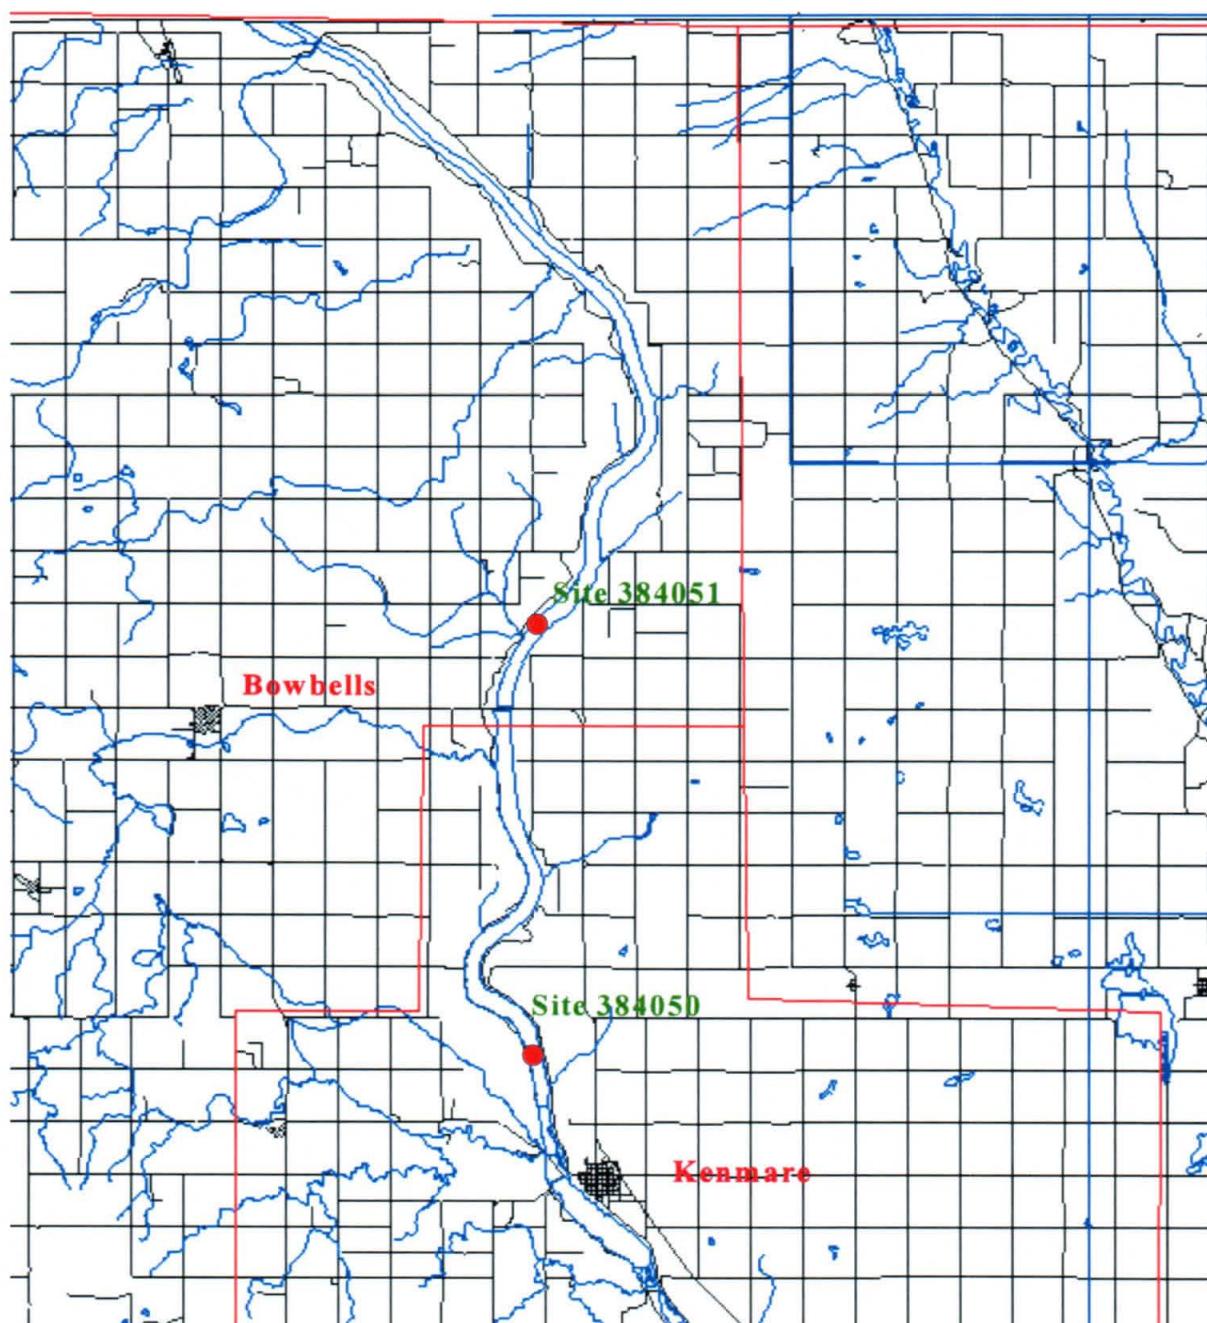

Figure 1. Map of Upper Des Lacs Lake and sampling locations.

Table 2. Water Quality Parameters

Analyte	Unit	Analyte	Unit
Temperature	C	Spc. Conductance	umhos/cm
Total Alkalinity	ppm	Bicarbonate	ppm
Carbonate	ppm	Total Ammonia	ppm
Total Kjeldahl Nitrogen	ppm	Nitrate + Nitrite as N	ppm
Total Phosphorus as P	ppm	Dissolved Phosphorus	ppm
Total Hardness as Ca	ppm	Calcium	ppm
Magnesium	ppm	Sodium	ppm
Potassium	ppm	Potassium	ppm
Iron	ppm	Manganese	ppm
Chlorides	ppm	Sulfates	ppm
Total Dissolved Solids	ppm	Boron	ppb

Beryllium	ppb	Chromium	ppb
Nickel	ppb	Copper	ppb
Zinc	ppb	Arsenic	ppb
Selenium	ppb	Silver	ppb
Cadmium	ppb	Antimony	ppb
Barium	ppb	Thallium	ppb
Lead	ppb	pH	

Water quality samples were collected from Upper Des Lacs Lake on 4 separate occasion and at 2 locations. Sampling times were May 21, August 12, and September 7, 1997, and February 23, 1998. Sampling locations are approximately $\frac{1}{2}$ miles upstream from the control structure, site 384050, and approximately $1\frac{1}{2}$ miles north of HWY 5, site 384051 (Figure 1). Water samples were collected over the thalway at the 2 discrete depths of $\frac{1}{2}$ meter below the surface and $\frac{1}{2}$ meter above the lake floor on each sampling visit.

At no time during the investigation was Upper Des Lacs Lake thermally stratified (Figures 2, 4, 6, 8). For the length of the project, dissolved oxygen concentrations remained above the State's Standards of 5 mg L^{-1} for a recreational fishery with a single exception on February 23, when the site above Hwy 5 (site 384051) dipped to 1.83 mg L^{-1} at a 2 meter depth (Figures 3, 5, 7, 9). This is not unusual in North Dakota with most water body's experiencing rapid dissolved oxygen depletion and a greater number of violations under ice cover conditions (Ell et. al 1993, Wax 1996).

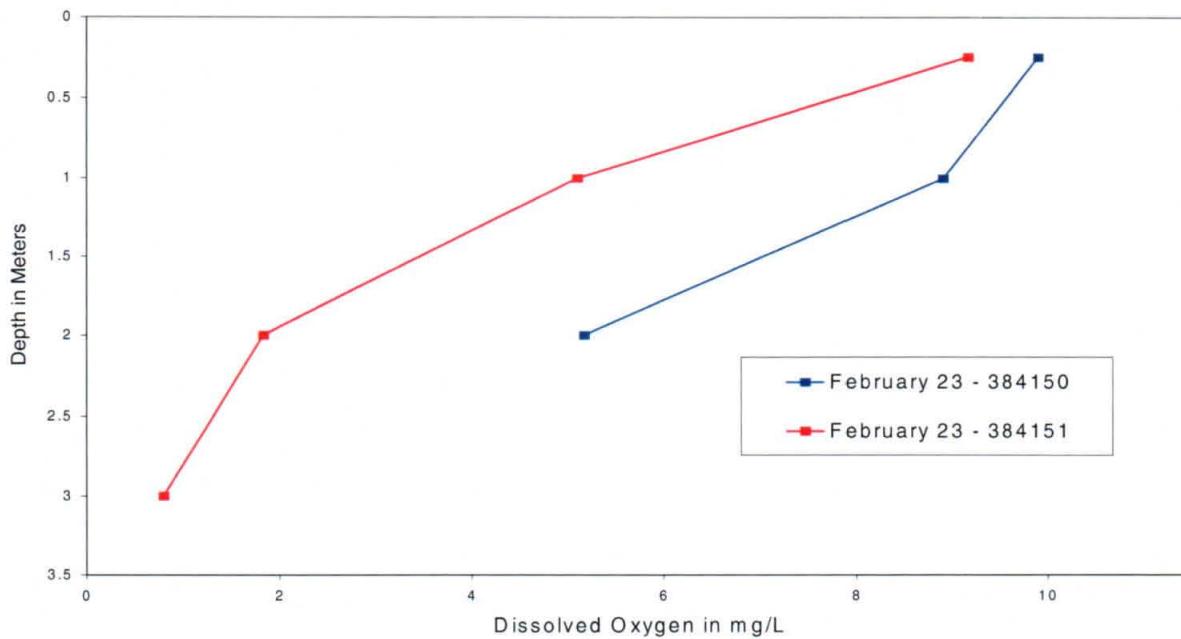

Figure 9. February 23, 1998 Upper Des Lacs Lake's oxygen profiles.

Water quality samples collected from Upper Des Lacs Lake describe a well buffered hypereutrophic reservoir. Total alkalinity as calcium ranged from 152 to 266 mg L⁻¹ with a mean of 214 mg L⁻¹. The dominate anions within the water column are bicarbonates and sulfates. Bicarbonates ranged from 188 to 324 mg L⁻¹ with a mean of 205 mg L⁻¹, while sulfates ranged between 202 and 293 mg L⁻¹ with a mean of 234 mg L⁻¹. Table 3 contains ranges for selected parameters within Upper Des Lacs Lake during the assessment project and North Dakota's arithmetic mean or all lakes and reservoirs sampled between 1985 and 1995.

Table 3. Concentration ranges for select parameters within Upper Des Lacs Lake and the North Dakota arithmetic mean for all lakes sampled between 1985 and 1995.

<u>Parameter</u>	<u>Des Lacs Lake's Range</u>	<u>1985-1995 mean</u>	<u>Unit</u>
Total Dissolved Solids	475-715	1271	mg L ⁻¹
Hardness as Calcium	168-253	428	mg L ⁻¹
Sulfate as SO ₄	202-293	408	mg L ⁻¹
Chlorides	5.9-21.2	234	mg L ⁻¹
Total Alkalinity as Calcium	152-266	309	mg L ⁻¹
Bicarbonate as HCO ₃	188-324	348	mg L ⁻¹
Conductivity	787-1120	1801	Omhos/cm
Total phosphorus as phosphate	0.11-0.385	0.295	mg L ⁻¹
Nitrate + Nitrite as Nitrogen	0.02-0.030	0.137	mg L ⁻¹
Total Ammonia as Nitrogen	0.01-0.637	0.269	mg L ⁻¹
<u>Total Kjeldahl Nitrogen</u>	<u>1.760-3.160</u>	<u>2.204</u>	<u>mg L⁻¹</u>

Total nitrogen as nitrogen and total phosphorus as phosphate concentrations ranged from 0.020 to 0.030 mg L⁻¹, and 0.11 to 0.385 mg L⁻¹, respectively, with mean concentrations of 0.020 and 0.233 mg L⁻¹. Total nitrogen to total phosphorus ratios ranged from 4.5:1 at site 384151 on August 12, 1997 to 18:1 at site 384150 on September 7, 1997. The 1997-98 annual nitrogen and phosphorus ratio for all 3 sites is 11:1, indicating that for most of the year and particularly during the productive times of the year Upper Des Lacs Lake is nitrogen limited. For purposes of this assessment a waterbody is assumed to be in nutrient equilibrium at a ration of nitrogen to phosphorus of 15:1 with a greater ratio indicating it is phosphorus limited and a smaller ratio nitrogen limited. When nitrogen becomes the limiting nutrient primary production is not limited but altered. The altered condition favors certain species of primary producers that are either able to affix nitrogen or are tolerant of low nitrogen conditions.

During the 1997-1998 investigation Upper Des Lacs Lake's trophic status was assessed as hypereutrophic. Trophic status is an estimation of a lake or reservoir's productivity. In general, as a lake ages it becomes more productive (eutrophication). When this maturing process reaches an advanced stage it is usually identified by loss of lake depth through sedimentation, and becomes less esthetically pleasing due to frequent algal blooms. When a lake is hypereutrophic it often also exhibit a foul order, suffer frequent fish kills, and have a rapid oxygen depletion during

thermal stratification and under ice cover conditions. Reservoirs which inundate large areas of deep fertile soils covered with organic growth are especially susceptible to rapid eutrophication and often begin life over productive.

For purposes of this project trophic status is measured using Carlson's Trophic Status Index (TSI) (Carlson 1977). Carlson's TSI was selected because of it's common use among limnologist and because it was developed for Minnesota lakes, a region close to North Dakota geographically.

Carlson's TSI uses a mathematical relationship based on secchi disk transparency, concentrations of total phosphorus at the surface, and chlorophyll-a concentrations. This numerical value then corresponds to a trophic condition ranging from 0 to 100 with increasing values indicating a more eutrophic condition. Carlson's TSI ranges are visually displayed in Figure 10.

Accurate trophic status assessment are essential in making sound management decisions. In order

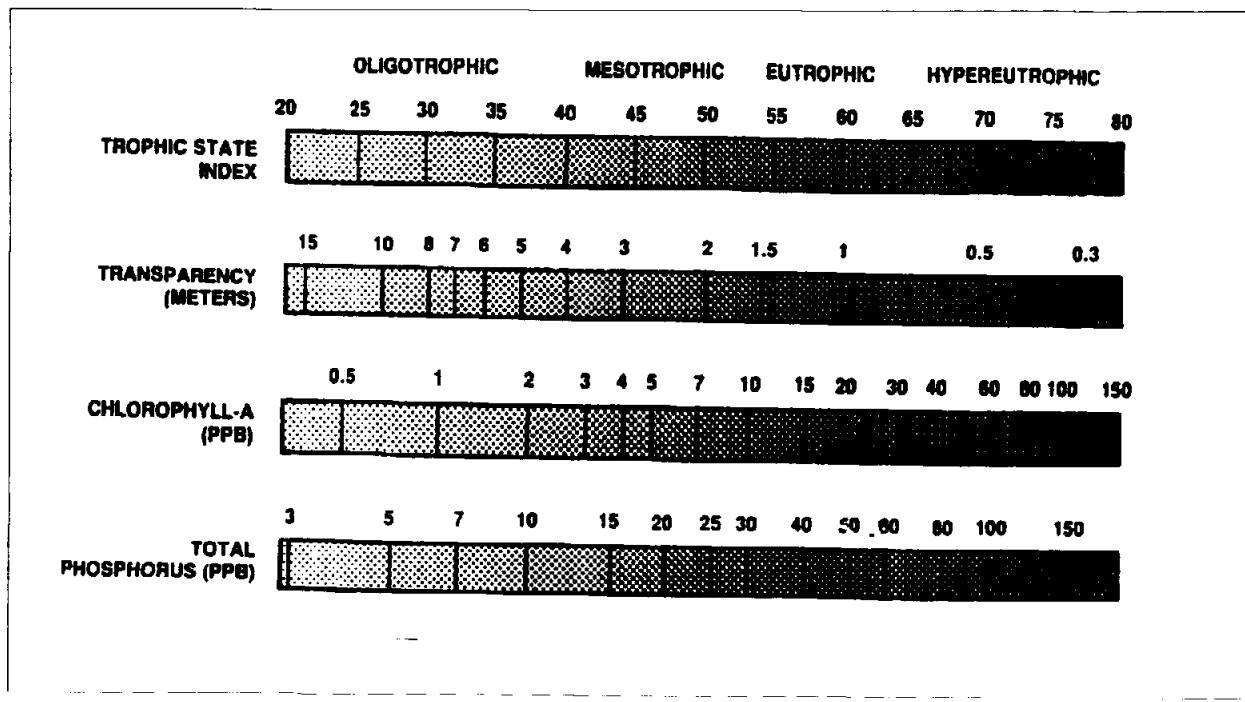

Figure 10. A graphic representation of Carlson's Trophic Status Index.

to ensure an accurate assessment has been made, usually 2 consecutive years of monitoring are desired and a multiple indicators approach should be used. The term indicator is used, as trophic status can be seasonally and annually variable, creating a situation where it can be easily mis-identified. Because this project lacks the resources for a second year of investigation, the trophic status assessment should be viewed with cautious skepticism.

Beyond general chemistry Des Lacs Lake was sampled for an array of trace elements and metals of these cadmium, copper, chromium, lead, nickel, silver, and zinc have both a chronic and acute limits set in the Standards of Water Quality for the State of North Dakota. The standard is hardness dependant and is calculated using the equations in Table 4.

Table 4. Trace element acute and chronic water quality standards for State of North Dakota.

Acute = $\exp(ma(\ln(\text{hardness}))+ba)$				
Chronic = $\exp(mc(\ln(\text{hardness}))+bc)$	Where:			
<hr/>				
Element	<u>ma</u>	<u>ba</u>	<u>mc</u>	<u>bc</u>
Cadmium	1.1280	-3.828	0.7852	-3.490
Copper	0.9422	-1.464	0.8545	-1.465
Chromium	0.8190	3.688	0.8190	1.561
Lead	1.2780	-1.460	1.2780	-4.705
Nickel	0.8460	3.361	0.8460	1.165
Silver	1.7200	-6.520	NA	NA
Zinc	0.8473	0.860	0.8473	0.7614

While none of the trace elements exceeded the State's acute standard, copper exceeded the State's chronic concentrations in 7 of 11 water samples analyzed. The accedence ranged from 3.1 to 11 ug L⁻¹. The 4 samples that did not exceed the State standard were significantly below, ranging between and 4.25 and 9.66 ug L⁻¹. A complete listing of all water quality data is contained in Appendix A.

Phytoplankton

Des Lacs Lake's Phytoplankton community was sampled twice during the summer of 1997. Des Lacs Lake's phytoplankton community is relatively diverse with representation from 7 orders and 56 genera (Appendix B). Phytoplankton can be used as indicators of nutrient availability and the trophic condition of a waterbody.

The order cyanophyceae, and bacillariophyceae dominated the population by density followed by chlorophyceae, cryptophyceae, chrysophyceae, euglenophyceae, and dinophyceae (Table 5) Order densities ranged from a low of none present for euglenophyceae and dinophyceae at the site above highway 5 (site 384051) to high of 256,998,000 cells/ml of cyanophyceae. In general, densities were highest above highway 5 (Figure 11).

Table 5. Mean algae densities for Upper Des Lacs Lake sampled August 12 and September 7, 1997.

Order	Near Dam (384050)	Above Hwy 5 (384051)
Chlorophyceae	4,372,000	8,523,200
Cryptophyceae	500,733	854,600
Cyanophyceae	124,800,484	175,917,500
Euglenophyceae	1,000	0
Dinophyceae	1,000	0
Chrysophyceae	128,567	776,475
Bacillariophyceae	44,956,902	2,659,800

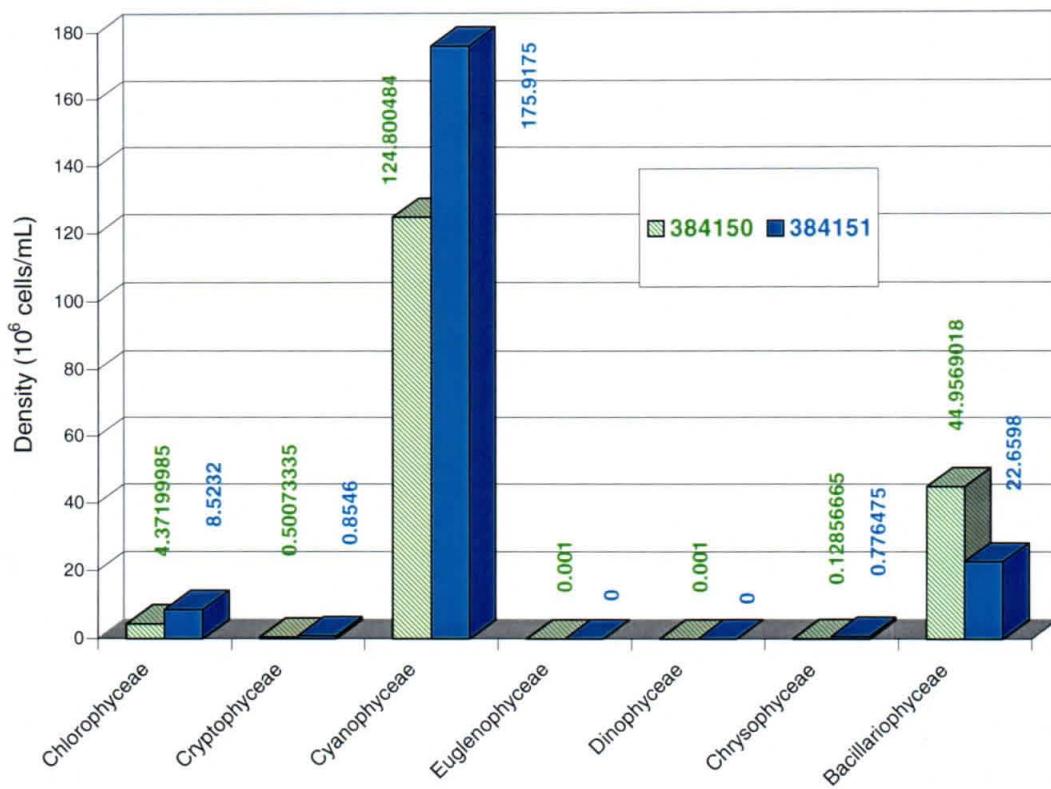

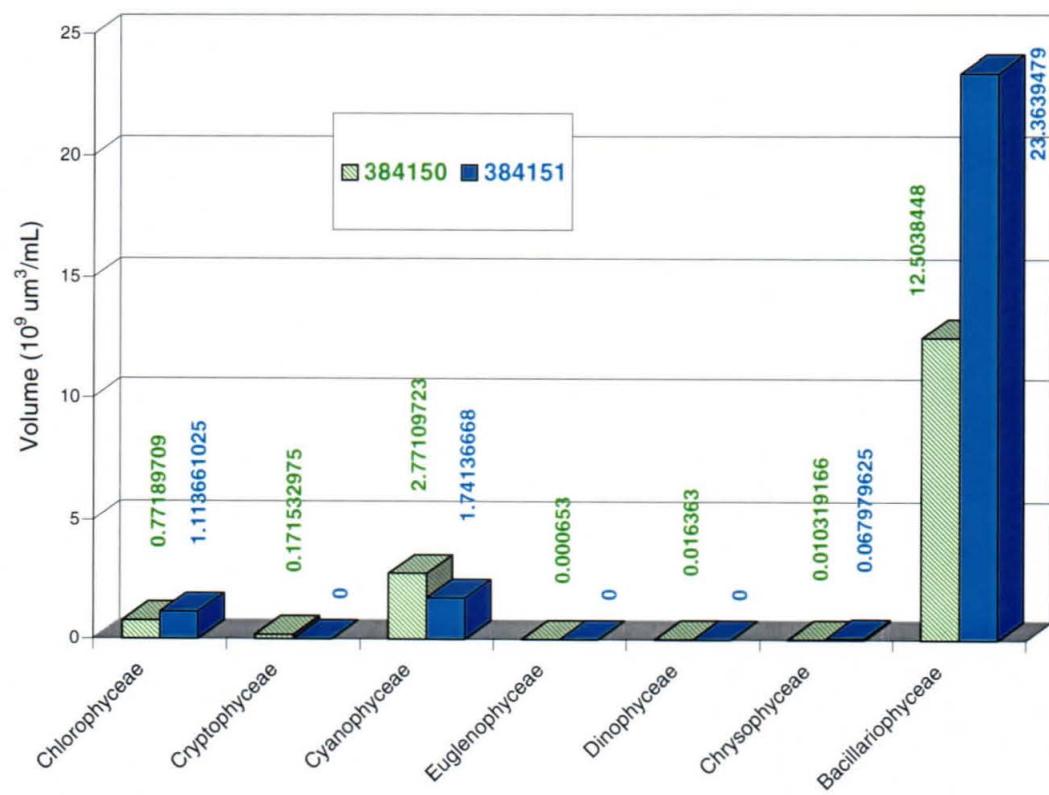

Figure 11. Mean algal densities expressed as cells/mL for August 12, and September 7, 1997.

The phytoplankton population by volume, expressed as cubic micrometers of algae per mL, is dominated by the order bacillariophyceae followed by cyanophyceae, chlorophyceae, cryptophyceae, chrysophyceae, dinophyceae, and euglenophyceae (Table 6, Figure 12). The order bacillariophyceae occupies a significantly large portion of the phytoplankton population by volume, and cyanophyceae a relatively small portion. This is opposite to the concentration of individual organism per mL of lake water (density) and is due to the relatively large size of the organisms in the order bacillariophyceae (Diatoms) and small size of the organisms in the order cyanophyceae (blue-green algae).

Table 6. Mean algae volumes for Upper Des Lacs Lake sampled August 12 and September 7, 1997.

Order	Near Dam (384050)	Above Hwy 5 (384051)
Chlorophyceae	771,897,090	1,113,661,025
Cryptophyceae	177,532,975	34,558,948
Cyanophyceae	2,771,097,230	1,741,366,680
Euglenophyceae	653,000	0
Dinophyceae	16,363,000	0
Chrysophyceae	10,319,167	67,979,625
Bacillariophyceae	12,503,844,798	23,363,947,900

Figure 12. Mean algal volumes expressed as um^3/mL for August 12, and September 7, 1997.

Sediment Analysis

Sediment samples were collected from Upper Des Lacs Lake at both water quality monitoring sites (Figure 1). Sediments were collected using a 1 inch core sampler, and sampling a minimum of the top six inches of sediments. Sediments have been analyzed for 12 elements and 14 pesticides (Table 7).

Table 7. List of analytes completed for sediment samples collected from Upper Des Lacs Lake in 1997.

Analyte	Analyte	Analyte
Aluminum (Al)	Manganese (Mn)	Iron (Fe)
Copper (Cu)	Zinc (Zn)	Barium (Ba)
Chromium (Cd)	Lead (Pb)	Mercury (Hg)
Hoelon	2-4-D	Dicamba
Dinoseb	MCPA	Tordon
2-4-5-T	Silvex	Pentachlorobenzoic Acid
Bromoxynil	Dichlorprop	Bentazon

Reported concentrations of trace elements in Upper Des Lacs Lake's deep water sediments are contained in Table 8. Sediment samples collected from Des Lacs Lake contained detectable levels of all elements analyzed for. In order to evaluate the sediment data for Upper Des Lacs Lake the results are compared to the deep water sediment samples collected from 87 North Dakota lakes and reservoirs between 1991 and 1995.

In summary, the reported concentrations are relatively high in comparison to the 50th and 100th percentiles of 87 deep water sediments collected from select North Dakota lakes and reservoirs. The reported concentrations of copper, barium, arsenic, selenium, lead, cadmium, and mercury all exceeded the 50th percentile, and zinc, and chromium exceeded the 100th percentile both samples collected (Table 8). No pesticide were detected in either sample collected.

Table 8. Reported concentration's of trace elements in Upper Des Lacs Lake's sediment and the 100th and 50th percentile from 87 sediment samples collected from select North Dakota lakes and reservoirs between 1991 and 1994.

Elements	1991-94 percentiles n=87		Upper Des Lacs Lake sediment results	
	50TH	100TH	Near Dam (384050)	Above Hwy 5 (384051)

=====
ND = Not Detected

NOTE: With the exception of VOC analytes # 40000 - 41999,
weight to weight unit analytes are reported as dry weight.
Use percent solids data to convert to wet weight if necessary.

NOTE: This report represents the current state of work in progress.
Additional analyses may change some of the results reported.

ND = Not Detected

NOTE: With the exception of VOC analytes # 40000 - 41999,
weight to weight unit analytes are reported as dry weight.
Use percent solids data to convert to wet weight if necessary.

NOTE: This report represents the current state of work in progress.
Additional analyses may change some of the results reported.
