Appendix A

August 14, 2012 WRIA Kick-off Meeting Agenda, Summary and Participant List

MEETING SUMMARY

Water Resources Inventory and Assessment (WRIA) for Cahaba National Wildlife Refuge

Meeting Date: Tuesday, August 14, 2012 (9:30 AM – 4:00 PM) CENTRAL TIME
Meeting Location: Jefferson County Shades Valley Training Center, Birmingham, AL

Meeting Purpose:

1. Provide an overview of the WRIA process including outcomes, and timelines for completion
2. Identify expertise, data, information, contacts, etc. for various sections within the WRIA process
3. Begin the WRIA process at Cahaba NWR
4. Collaborate and share information/data about the river, refuge, management issues and other related work happening in the watershed including public education/outreach.

Goals and Objectives:

WRIA - The goal of the National Wildlife Refuge System (NWRS) Water Resources Inventory and Assessment (WRIA) effort is to provide up-to-date, accurate data on Refuge System water quantity and quality in order to acquire, manage, and protect adequate supplies of clean and fresh water.

a. Achieve a greater understanding of existing refuge water resources
b. Identify potential concerns or threats to those resources
c. Provide a basis for wildlife habitat management and operational recommendations

Meeting Agenda:

TUESDAY – August 14, 2012

9:30 AM – 11:00 AM – Welcome, Meeting Logistics, and Introductions

- Welcome
- Introductions (all) – (everyone give quick overview/status update of Cahaba River effort(s))
- Overview of Water Resource Assessment work in FWS, status (Susan Cielinski, FWS)
- Brief introduction to the refuge and its management history (Sarah Clardy, FWS)
- Overview of Cahaba River including biological resources, past disturbance, future threats, personal experience, long-term view of Cahaba River (Paul Freeman, TNC; Theresa Thom, FWS; all participants)

11:00 AM – 11:15 AM (BREAK)

11:15 AM – 12:15 PM – Water Resources Inventory and Assessment (WRIA) Process

- Introduction, goals, timeline and data needs for WRIA process (John Faustini, FWS)
- Presentations on data already collected for Cahaba River (Rebecca Burns & Kirsten Hunt, Atkins)
- Discussion about data, data gaps, potential sources, contacts, management issues, timeline, etc.

12:15 PM – 1:15 PM – (LUNCH)

1:15 PM – 4:00 PM – Water Resource Inventory and Assessment (WRIA) Process (continued)

- Discussion of the WRIA spreadsheet data items (group contributions)
- Assignments for data needs, milestones, etc.
- Dates for future meetings/follow-up for WRIA
- Other action items

NEXT MEETING:
(conference call scheduled for Wed., Oct. 3, 2012 (11:00 Eastern/10:00 AM Central)

Attendees:

Last Name	First Name	Affiliation	E-mail
Allen	Brad	Atkins Global	thomas.allen@atkinsglobal.com
Barnhill	Laurel	USFWS - Inventory & Monitoring	laurel_barnhill@fws.gov
Black	Gordon	Cahaba River Society	clean@cahabariversociety.org
Burns	Rebecca	Atkins Global	rebecca.burns@atkinsglobal.com
Cielinski	Sue	USFWS - Regional Office	susan_cielinski@fws.gov
Clardy	Sarah	USFWS - Refuge Manager	sarah_clardy@fws.gov
Duncan	Will	USFWS - GA ES Office	will_duncan@fws.gov
Faustini	John	USFWS - Regional Hydrologist	john_faustini@fws.gov
Freeman	Paul	The Nature Conservancy	pfreeman@tnc.org
Gray	Dana	Jefferson County	grayd@jccal.org

Hunt	Kirsten	Atkins Global	kirsten.hunt@atkinsglobal.com
Johnson	Paul	Alabama Aquatic Biodiversity Center - ADCNR	Paul.Johnson@dcnr.alabama.gov
Marlowe	Karen	USFWS - Daphne ES/Birmingham sub-office	karen_marlowe@fws.gov
McGregor	Stuart	Geological Survey of Alabama	smcgregor@gsa.state.al.us
Powell	Jeff	USFWS - Daphne ES Office	jeff_powell@fws.gov
Spadgenske	Eric	USFWS - Partners Program	eric_spadgenske@fws.gov
Thom	Theresa	USFWS - Inventory & Monitoring	theresa_thom@fws.gov

Meeting Summary:

Sue Cielinski (FWS – Regional Office)

WRIA Background in the Southeast Region:

Historically the USFWS has had a limited focus on refuge hydrology in the Southeast Region because of its plentiful water supply and a lack of perceived stress on resources; however, recent droughts, floods and climate change have begun to change the picture. In 2007 the USFWS began identifying water resource concerns on refuges (e.g., baseline information, minimum flows, need for hydrologists, water control issues, levees, etc.). This prompted a water study started in 2008 on several refuges with USGS (Gary Buell) that is still ongoing. The study is meant to assess water issues related to the quantity and timing of flow on some southeastern refuges originally identified as having critical water resource needs: Cahaba River NWR (Alabama), Cache River NWR (Arkansas), White River NWR (Arkansas), Lower Suwanee NWR (FL), Caloosahatchee NWR (FL) and Ding Darling NWR (FL). Information from this study is being compiled (including information on Cahaba NWR) and it is being applied to the WRIAs. Also in 2008, the USFWS created a national water team to address water issues nationwide. They began putting together a water resources assessment (precursor to WRIA) and the template was used as the basis for the WRIAs. In 2009 Eastern and Western climate change water teams were assembled and charged to assess Service needs related to water and climate change, as well as to identify refuges where water quantity and quality issues are important concerns. There are several initiatives going on right now,

related to water. The USFWS Inventory and Monitoring (I&M) group is now helping to integrate these previous efforts in a more organized way. Specifically for Cahaba NWR, the WRIA process was actually started in 2009 with the Refuge Manager at the time (Steve Miller) which included a site visit. The process is now being rejuvenated and moving forward.

Sarah Clardy (FWS – Cahaba River NWR Manager)

Introduction to Cahaba River NWR:

- The refuge was established on September 25, 2002 (celebrating 10 years this fall); Sarah has been refuge manager since Oct 2011. Cahaba River NWR is administered together with Watercress Darter NWR and Mountain Longleaf NWR, all in Alabama. There are 11 refuges in AL.
- Cahaba NWR was established to conserve and protect water quality for aquatic species, and to manage and restore longleaf pine. Improving recreational access is also a management goal. Recreation includes water recreation, hunting, fishing, nature observation & photography.
- Cahaba NWR is very biologically rich, so managing biodiversity is very important.
- 3600 acres currently, within a 7600-acre acquisition boundary.
- The history of the land now protected as Cahaba NWR includes coal mining. It was last mined in the 1950s (maybe into the 1970s). Mining included underground and surface mining. There are remnant rock walls from strip mining and spoils and the refuge is in the midst of putting together a reclamation project (100 acres) to push the spoils "hill" toward the "high wall" to restore the area's hydrology and to fill a mine shaft which is leaching arsenic and strontium. At times the mine shaft is completely flooded and at other times it is without water.
    - QUESTION: How much water is entering the mine shaft, and leaching out?
        - DATA / SUPPORT NEED: sampling methodology to evaluate impact and effectiveness of restoration actions. Follow-up w/FWS Contaminants Program.
        - The area's coal is notorious for arsenic, nickel and high strontium levels. One-time soil samples were collected at 3 locations and other samples are planned to be collected as reclamation proceeds. Guidance is needed for sampling protocol(s) to evaluate restoration activity effectiveness.
        - Discussion: Jeff Powell suggested using ground penetrating radar or other techniques now available to evaluate extensiveness of underground mine shaft(s) within refuge boundaries. Need contact(s)
    - FOR FOLLOW UP: Other sampling done by ADEM and GSA that might be useful. The reclamation project should begin in winter 2012-13. Sarah has GIS layers of the mine location & reclamation project limits.
- Timber production is also part of the refuge's history with abundant loblolly pine plantations remaining. These are being managed to slowly restore to longleaf pine. Some clear-cutting and longleaf planting has been done and now controlled burning is needed.

Paul Freeman (TNC)

Overview of Cahaba River:

- The Cahaba River drains 1800 sq miles and flows 191 miles, with the upper half above the fall line and the lower half within the coastal plain. Elevations range from 100-900 feet within the

watershed. The headwaters are located north of Birmingham. The upstream area is a wide, shallow stream through bedrock shoals, then bluffs. In the downstream area (coastal plain) the river includes oxbow lakes, blackbelt chalk and prairie cliffs.

- The Cahaba is one of the longest freeflowing rivers in Alabama with only one reservoir (Lake Purdy in Birmingham on the L. Cahaba). Historically there were mill dams and small dams on the mainstem but most have been removed or breached. There is still a dam at Highway 280 in Birmingham that was built 100 years ago to stabilize the pool for drinking water withdrawals and is still being maintained to manage water levels in the river. It is 15 feet high, backs up water for 3.5 miles upstream and has a non-functioning fish ladder. It is the only significant remaining structure on the main branch of the Cahaba River.
- There are 135 species of fish in the Cahaba. Migratory and diadromous fish are declining in the river. There are several listed fish species, and some species may be extirpated.
- The Cahaba River is in the top 5-10 rivers in the US for total freshwater mussel species abundance, with 38 of 48 spp. previously identified in the Cahaba believed to still be present, although reproduction and recruitment is thought to be declining for many mussel species.
- Large diversity of freshwater snails; Cahaba is among the most species-rich rivers in N. America. 32 0f 39 spp. prev. identified are believed to still be present.
- 14+ species of turtles
- There are more species of freshwater crayfish in Alabama than any other state (12+; only 2 are non-native).
- There are 156 species of caddisflies in the river, as well as many birds, mammals, etc.
- There are several endemic plant species including the Rocky Shoals Spider Lily/Cahaba Lily and those in the Ketona Glades (primarily Bibb County).
- **Past, present and future threats** to the river include deforestation, agriculture, resource extraction (natural gas may be an issue in future; rock quarries are still an issue), urban growth, habitat fragmentation, industrial, discharge including wastewater (i.e., pharmaceutical/other chemicals from industrial, municipal, residential sources that are not fully removed from water treatment plants), invasive species (i.e., Asian clam, northern crayfish, common carp, grass carp), water withdrawals (the state is in the process of determining its water policy; the upper 1/3 of the watershed is affected by water withdrawals from the Birmingham area), climate change and overharvesting of turtles, mussels and crayfish.

Discussion

- There is a draft TMDL currently out for public comment for siltation (habitat alteration) on the upper portion of the Cahaba River: http://www.adem.state.al.us/newsEvents/notices/aug12/8tmdls.htm. The comment period was extended for another 45 days starting August 14, 2012. It was noted that the NPDES permit writers should be encouraged to be involved in development of the implementation discussion in the TMDL document.
- ADEM (with EPA) conducted a survey of diatoms on the Cahaba River and Padgett Creek (reference creek). Georgia State College is conducting a diatom study on the river this summer. ADEM has diatom samples but lacks the funding for species level identification.

- Downstream Dams: Two dams were built on the Alabama River in 1970s (Clayburn and Millers Ferry). Since then there has been a decline in migratory and diadromous fish on the Cahaba River. These dams may impact upstream mussel populations due to loss of host fish migration(s).
- Atmospheric Deposition: There is atmospheric deposition of pollutants in the Cahaba River basin. Metals and toxins present in the river could be airborne. Birmingham has air quality issues (e.g., ozone, smog) and surface runoff. In addition to airborne pollutants, historic impacts like coal fines are still moving down the system decades after extraction.
- Hydraulic fracking is occurring adjacent to the refuge. The GSA Oil and Gas Board keeps track of wells (GIS shapefiles at http://www.ogb.state.al.us/ogb/gis_data.aspx). Brine disposal goes into the Black Warrior Basin, not the Cahaba River Basin.
- Nutrient Loading: There are a significant number of septic tanks within the system. Upwards of $1 billion has been spent to upgrade the sewage system to fix leaks within the past 12 years so there should be observations of improved water quality in the Cahaba. Paul Freeman noted he has seen fewer algal blooms in the past 10 years. Chicken processing plants have gone out of business which has lessened nutrient impacts. Monitoring has shown an expansion of threatened and endangered in both range and number in the same time period. Only in recent years has ADEM begun to incorporate Phosphorus limits (total phosphorus) in its TMDL permits.
- Sedimentation: There are high sediment loads throughout the system, but it's better than it used to be. There was an improvement when the Stormwater Management Authority existed, but developers have limited its influence. The economy has limited new growth/development in watershed. Due to safety reasons, ADEM has not conducted sediment monitoring of the Cahaba during high flows, when sediment is being transported at a high rate.
    - QUESTION/DATA NEED: Can automated sediment sampling equipment be added at the USGS stations? ADEM uses biotic indexes as a proxy for siltation because it sediment transport and siltation is hard to quantify, and is currently in the process of reassessing and revising its macroinvertebrate scores for Alabama (with EPA input).
    - QUESTION: Are there any past or ongoing investigations on the effect of urbanization on streamflows in the Cahaba and related to siltation?
        - ANSWER: Look at USGS land use studies on impervious surfaces (8-10 years old). There is discussion of discontinuing the USGS NAWQA (Valley Creek, Pelham, AL) site, which has 15 years of data on water quality, invertebrates, periphyton and a long-term continuous WQ monitoring station. http://water.usgs.gov/nawqa/urban/html/birmingham.html
        - FOR FOLLOW UP: Talk to USGS (Rick Treece) about funding and cooperating.

John Faustini (USFWS – Region 4 Hydrologist)

WRIA Process:

- The primary focus of the WRIA is on surface water, but groundwater information is also included. The national WRIA database is under development and should be available by the end of the year to house all of the WRIA information.
- There used to be a USGS gage north of the refuge (USGS), but it is not currently active.

  - FOR FOLLOW UP: Look into the possibility of reactivating this gage. Examine where other gages are located in the watershed to prioritize data need(s)/gage locations.

- A SharePoint site will be used to house all files related to the WRIA. Files will be organized categorically and can be sent to Theresa Thom/John Faustini for upload.
  - https://connect.doi.gov/fws/Portal/sewr/HGM-WRIA/Cahaba/

Rebecca Burns (Atkins)

Cahaba WRIA Data Collected To Date:

- Atkins has collected facility information, as well as hydroclimatic (temperature, precipitation, streamflow), NHD, NWI and EPA water quality data and information on USGS NWIS monitoring sites. In addition, Atkins has collected geological, soil, groundwater, water quality monitoring and aquatic monitoring information and data. With this information Atkins has begun to draft some figures and tables.
- One issue Atkins encountered relates to the refuge boundaries. The most recent USFWS cadastral data include a different approved/acquired boundary for the refuge. It was determined that the WRIA should use the same boundaries as are being used for the refuge's CCP.

Discussion

- The Strategic Habitat Unit (SHU) project is developing an online mapping server to upload data and baseline information. As the first step, habitat information (stream impacts, etc.) is being uploaded. A map of the SHUs was distributed.
  - Strategic Habitat Units (SHU) Map for Alabama – upload map to Sharepoint. Watershed prioritization for conservation efforts in Alabama. http://www.gsa.state.al.us/gsa/eco/pdf/SM_248.pdf
- The Heritage database is the most comprehensive database of water studies on the Cahaba River, the most studied river in Alabama.
- The Cahaba River Blueway is an initiative of TNC and the Alabama Innovation Engine to put up signage and develop a cohesive put-in/takeout system. An information sheet was distributed (thank you Matt Leavell).

Theresa Thom (USFWS – I&M)

WRIA Spreadsheet:

Fill out spreadsheet – data/information needs for WRIA process. Goal is to have information listed on spreadsheet uploaded to sharepoint by end of September 2012. Spreadsheet will be uploaded to Cahaba Sharepoint site and updated with data acquisition progress.

- John Faustini would like for the WRIA to include SSURGO info for the entire Cahaba River watershed. Analysis should focus on hydric/non-hydric soils.
- Springs/seeps – Little Ugly at headwaters? Look at aerial imagery. GSA publications – search as keyword. GSA has publication of springs of AL (1987)
- Appropriate scale of information is on a case by case basis.

- GSA website – search for publications by county (geologic/topographic maps) www.gsa.state.al.us, some reports have information on water availability by county.
- USGS bridge scour study in 1980s, 90s (bridge scour program) – GA, AL, TN, NC- fluvial dynamics. Unconsolidated areas are where biological resources are found. Lower end of the system (below the fall line) more active. Very little stable stream bottom in coastal plain.
- Flooding/models – ADEM has tied to nutrient and siltation TMDLs (models). Atkins (USGS) report in 2007 on magnitude and frequency of floods in AL (Hedgcock and Fester 2007). 2007-5204 (Sci Investigations Report). Active River Area (TNC process that predicts floodplain inundation/flows) – Paul to send link to paper - DONE.
- Only built structure on refuge will be the overlooks (trail). There are trails, roads, boat ramps (handicapped fishing access but used as boat ramp), parking, access points, kiosks
- Proposed reclamation will affect elevation
- www.ogb.state.al.us – map of oil and gas wells
- Dams and structures – dams inventory, AL office of water resources
- Upstream climatological data from Birmingham (USHCN?)
- AL is riparian rights state. Refuge owns small tributary streams (if you own both sides). State owns riverbed of mainstem. Copy of water rights info by state on sharepoint site.
- Mercury deposition from coal-fired power plants washing down river.
- Interbasin water transfers within Cahaba River Watershed = net loss for Cahaba
- EPA Healthy Watershed Survey – Mobile Bay (contact is Roberta Swan) = land use in Cahaba included.

Dates for Future Meetings and Other Action Items:

- John Faustini (FWS) will coordinate getting everyone access to the SharePoint site: https://connect.doi.gov/fws/Portal/sewr/HGM-WRIA/Cahaba/
- The notes from this meeting will be uploaded to the SharePoint site and sent to the group.
- All information outlined and requested on the Cahaba spreadsheet will be compiled and sent to Theresa Thom to upload to the SharePoint site by the end of September 2012.
- **A teleconference will be held on October 3, 2012 10am CT/11am ET to report progress. Please join us. The call information will be sent out prior to the call.**
- USFWS and Atkins hold monthly calls to report out on progress. Notes from these calls will be added to the SharePoint site.
- Outreach about process could be provided at Cahaba Lilly Festival, Cahaba Clean Water Partnership, etc. There are opportunities for outreach about the WRIA process/progress.

Appendix B

Listed and Petitioned Species within the Cahaba Basin (8-Digit HUC – 03150202)

Appendix B.1. Federally Listed Species Found in the Cahaba River Basin and Status

Appendix B.2. Native Freshwater Mussels Found in the Cahaba River (found live during surveys)

Appendix B.3. Native Mussel Species Historically Occurring in the Cahaba River

Appendix B.4. Gastropod Species Documented Alive in the Cahaba River during surveys (2011)

Appendix B.5. Gastropod Species Historically Documented from the Cahaba River

Appendix B.6. Fish Species Found in the Cahaba River Basin (03150202) from recent survey data

Appendix B.7. List of Actual and Potential Reptile and Amphibian Species for Cahaba River NWR

Appendix B.8. Potential and Documented Mammals for Cahaba River NWR

Appendix B.9. Petitioned Species Occurring Within the Cahaba River Basin (03150202)

Appendix B.1. Federally Listed Species Found in the Cahaba River Basin (03150202) and Status Within Cahaba River NWR, AL as of July 2013.

Family	Genus	species	Common Name	ON REFUGE	Status
Frogs and Toads					
Bufonidae	*Bufo*	*fowleri*	Fowler's toad	X	
	Bufo	*quercicus*	Oak Toad		
	Bufo	*terrestris*	Southern Toad		
Hylidae	*Acris*	*crepitans*	Northern Cricket Frog	X	
	Acris	*gryllus*	Southern Cricket Frog	X	
	Hyla	*avivoca*	Bird-voiced Treefrog		
	Hyla	*chrysoscelis*	Cope's Gray Treefrog	X	
	Hyla	*cinerea*	Green Treefrog	X	
	Hyla	*femoralis*	Pine Woods Treefrog		
	Hyla	*gratiosa*	Barking Treefrog		
	Hyla	*squirrela*	Squirrel Treefrog		
	Pseudacris	*brachyphona*	Mountain Chorus Frog	X	
	Pseudacris	*crucifer*	Spring Peeper	X	
	Pseudacris	*feriarum*	Upland Chorus Frog		
	Pseudacris	*ornata*	Ornate Chorus Frog		
Microhylidae	*Gastrophryne*	*carolinensis*	Eastern Narrowmouth Toad	X	
Ranidae	*Rana*	*catesbeiana*	Bullfrog	X	
	Rana	*clamitans*	Green/Bronze Frog	X	
	Rana	*sphenocephala*	Southern Leopard Frog	X	
Scaphiopodidae	*Scaphiopus*	*holbrookii*	Eastern Spadefoot Toad		
Salamanders					
Ambystomatidae	*Ambystoma*	*maculatum*	Spotted Salamander	X	
	Ambystoma	*opacum*	Marbled Salamander		
	Ambystoma	*talpoideum*	Mole Salamander		
	Ambystoma	*tigrinum*	Eastern Tiger Salamander		S3
Plethodontidae	*Desmognathus*	*conanti*	Spotted Dusky Salamander	X	
	Desmognathus	*monticola*	Seal Salamander	X	SP
	Eurycea	*cirrigera*	Two-lined Salamander	X	
	Eurycea	*guttolineata*	Three-lined Salamander	X	
	Gyrinophilus	*porphyriticus*	Spring Salamander		
	Hemidactylum	*scutatum*	Four-toed Salamander		S3
	Plethodon	*glutinosus*	Slimy Salamander (complex)	X	
	Plethodon	*ventralis*	Southern Zigzag Salamander	X	
	Plethodon	*websteri*	Webster's Salamander	X	
	Pseudotriton	*ruber*	Red Salamander	X	
	Necturus	*beyeri*	Beyer's Waterdog		
	Notopthalmus	*viridescens*	Red-spotted Newt	X	
Sirens					
Sirenidae	*Siren*	*intermedia*	Eastern Lesser Siren		
Crocodillians					
Alligatoridae	*Alligator*	*misissippiensis*	American Alligator		
Lizards and Snakes					
Anguidae	*Ophisaurus*	*attenuatus*	Eastern Slender Glass Lizard		
	Ophisaurus	*ventralis*	Eastern Glass Lizard		

Appendix B.7. List of actual and potential reptile and amphibian species occurring within Cahaba River National Wildlife Refuge (Godwin 2010).

Family	Genus	species	Common Name	ON REFUGE	Status
Phrynosomatidae	*Sceloporus*	*undulatus*	Easterb Fence Lizard	X	
Polychrotidae	*Anolis*	*carolinensis*	Green Anole	X	
Scincidae	*Eumeces*	*anthracinus*	Southern Coal Skink		P2, S3
	Eumeces	*egregius*	Mole Skink		
	Eumeces	*fasciatus*	Five-lined Skink	X	
	Eumeces	*inexpectatus*	Southeastern Five-lined Skink		P2, S3
	Eumeces	*laticeps*	Broad-headed Skink	X	
	Scincella	*lateralis*	Ground Skink	X	
Teiidae	*Cnemidophorus*	*sexlineatus*	Eastern Six-lined Racerunner	X	
Colubridae	*Cemophora*	*coccinea*	Scarlet Snake		
	Coluber	*constrictor*	Black Racer	X	
	Elaphe	*guttata*	Corn Snake		
	Elaphe	*obsoleta*	Gray Rat Snake	X	
	Lampropeltis	*calligaster*	Mole Kingsnake		S3
	Lampropeltis	*getula*	Eastern Kingsnake	X	P2, S4
	Lampropeltis	*triangulum*	Scarlet Kingsnake		
	Masticophis	*flagellum*	Eastern Coachwhip		S3
	Opheodrys	*aestivus*	Rough Green Snake	X	
	Pituophis	*melanoleucus*	Northern Pine Snake		P2, S3
	Tantilla	*coronata*	Southeastern Crowned Snake		
Dipsadidae	*Carphophis*	*amoenus*	Eastern Worm Snake	X	
	Diadophis	*punctatus*	Ringneck Snake	X	
Natricidae	*Nerodia*	*erythrogaster*	Yellow-bellied Water Snake		
	Nerodia	*rhombifer*	Diamond-backed Water Snake		
	Nerodia	*sipedon*	Midland Water Snake	X	
	Regina	*rigida*	Glossy Crayfish Snake		
	Regina	*septemvittata*	Queen Snake	X	
	Storeria	*dekayi*	Brown Snake	X	
	Storeria	*occipitomaculata*	Red-bellied Snake	X	
	Thamnophis	*sauritus*	Eastern Ribbon Snake		
	Thamnophis	*sirtalis*	Eastern Garter Snake	X	
	Virginia	*striatula*	Rough Earth Snake		
	Virginia	*valeriae*	Eastern Smooth Earth Snake		
Xenodontidae	*Farancia*	*abacura*	Mud Snake		
	Farancia	*erytrogramma*	Rainbow Snake		P2, S3
	Heterodon	*platyrhinos*	Eastern Hognose Snake	X	
Elapidae	*Micrurus*	*fulvius*	Eastern Coral Snake		P2, S3
Crotalidae	*Agkistrodon*	*contortrix*	Copperhead	X	
	Agkistrodon	*piscivorous*	Eastern Cottonmouth	X	
	Crotalus	*horridus*	Timber Rattlesnake	X	
	Sistrurus	*miliarius*	Pigmy Rattlesnake		
Turtles					
Chelydridae	*Chelydra*	*serpentina*	Common Snapping Turtle		
	Macrochelys	*temminckii*	Alligator Snapping Turtle		SP, P2, S3
Emydidae	*Deirochelys*	*reticularia*	Chicken Turtle		S3

Scientific Name	Common Name	ON REFUGE	Federal Status	State Status
Didelphis virginiana	Virginia Opossum			
Blarina carolinensis	Southern Short-tailed Shrew			
Sorex longirostris	Southeastern Shrew			
Cryptotis parva	Least Shrew			
Sorex longirostris	Southeastern Shrew			
Scalopus aquaticus	Eastern Mole			
Myotis grisecens	Gray Bat	X	E	SP, P1, S2
Myotis lucifugus	Little Brown Myotis			P2, S3
Myotis austroriparius	Southeastern Myotis			P2
Myotis septentrionalis	Northern Long-eared Bat			P2, S2
Myotis sodalis	Indiana Bat		E	SP, P1, S2
Lasiurus borealis	Eastern Red Bat	X		
Lasiurus cinereus	Hoary Bat	X		
Lasiurus seminolus	Seminole Bat	X		
Lasionycteris noctivagans	Silver-haired Bat			
Pipistrellus subflavus	Eastern Pipistrelle	X		
Eptesicus fuscus	Big Brown Bat	X		
Nycticeius humeralis	Evening Bat	X		
Corynorhinus rafinesquii	Rafinesque's Big-eared Bat			SP, P1, S2
Tadarida brasiliensis	Brazilian Free-tailed Bat	X		P2, S3
Dayspus novemcinctus	Nine-banded Armadillo			
Sylvilagus aquaticus	Swamp Rabbit			
Sylvilagus floridanus	Eastern Cottontail			
Tamias striatus	Eastern Chipmunk			
Marmota monax	Woodchuck			
Sciurus carolinensis	Eastern Gray Squirrel			
Sciurus niger	Eastern Fox Squirrel			S3
Glaucomys volans	Southern Flying Squirrel			
Castor canadensis	American Beaver			
Oryzomys palustris	Marsh Rice Rat			
Reithrodontomys humulis	Eastern Harvest Mouse			
Peromyscus gossypinus	Cotton Mouse			
Peromyscus leucopus	White-footed Mouse			
Peromyscus polionotus	Oldfield Mouse			
Ochrotomys nuttalli	Golden Mouse			
Sigmodon hispidus	Hispid Cotton Rat			
Neotoma floridana	Eastern Wood Rat			
Microtus pinetorum	Woodland Vole			
Ondatra zibethicus	Common Muskrat			
Rattus rattus	Black Rat			
Rattus norvegicus	Norway Rat			
Mus musculus	House Mouse			
Canis latrans	Coyote			
Vulpes vulpes	Red Fox			
Urocyon cinereoargenteus	Common Gray Fox			
Procyon lotor	Northern Raccoon			

Appendix B.8. Potential and Documented Mammals For Cahaba River National Wildlife Refuge, AL

Scientific Name	Common Name	ON REFUGE	Federal Status	State Status
Mustela frenata	Long-tailed Weasel			SP, P2, S3
Mustela vison	American Mink			
Lontra canadensis	Northern River Otter			
Spilogale putorius	Eastern Spotted Skunk			P2, S3
Mephitis mephitis	Striped Skunk			
Spilogale putorius	Eastern Spotted Skunk			
Lynx rufus	Bobcat			
Odocoileus virginianus	White-tailed Deer			
Sus scrofa	Feral Swine

Piper II Mine Reclamation Plan

Robert Bentley
Governor

G. Thomas Surtees
Commissioner

STATE OF ALABAMA
DEPARTMENT OF LABOR

February 28, 2013

Mrs. Sarah Clardy
Refuse Manager
Cahaba River National Wildlife Refuge
P.O. Box 5087
Anniston, AL 35205

Dear Sarah,

As you have been previously discussing with Michael Vinson, this letter is being written to advise you that we still plan to send a set of preliminary construction plans and contract specifications in the mail on Friday, March 1, 2013, and e-mail a pdf file of each. When you receive this packet of information, you may begin the process of having the trees removed from the site. We have approximately 33+/- acres of actual disturbed area in the plans but have allowed for 35 acres in the specifications and quantities just in case the timber is cut a little outside of our limits.

It is important that we obtain the signed Consent Form from the USFWS on this project in a timely manner to allow us to proceed with the design and eventually let it for bid so that our AML contractor can perform the construction work. The signature block(s) have been left blank to allow you to fill in the names and titles of the appropriate individuals that will need to sign the form, unless you can tell us in advance who the signee(s) will be. If so, we can include their name(s) and titles(s) on the form.

It is our intention, barring any unforeseen problems or discussions from the USFWS, to let this project for bid by April 15, 2013, and show the project to interested contractors by May 10, 2013. In this case, the bids should be opened around May 24, 2013, and construction could begin approximately July 15, 2013 – August 1, 2013. This allows you the time that you needed (three months) to have the timber removed on this phase of our Piper AML Project.

ABANDONED MINE LAND RECLAMATION OFFICE CHUCK WILLIAMS, FIELD SUPERVISOR
11 WEST OXMOOR ROAD SUITE 100 BIRMINGHAM, ALABAMA 35209
Telephone: (205) 945-8671 Fax: (205) 945-8685

As you and Michael have discussed, it is very important to have the site revegetated and stabilized as soon as possible once the grading operations have been completed. In addition to your suggested grass seed mixture, we have added some native species that we hope you will find acceptable. We are in the process of verifying the availability and cost of the proposed mixture with our usual seed company(ies). If available and reasonably priced, this mixture will be included in our contract specifications. However, if USFWS requires, it could be modified provided we are notified before our expected bid let date (04/5/13).

Our proposed mixture is as follows:

Winter Wheat	40 lbs./acre
Annual Rye	15 lbs./acre
Little Bluestem	4 lbs./acre
Big Bluestem	4 lbs./acre
Switchgrass	5 lbs./acre
Partridge peas	7 lbs./acre
Kenland Red Clover	20 lbs./acre
Durana Clover	15 lbs. acre
Total	110 lbs./acre

We have been involved for over 30 years with stabilizing AML reclamation sites in various Alabama minespoil soil types. Although overall success is very dependent upon unpredictable weather conditions at and following the time of seedbed preparation and planting, through much trial and error our current revegetation prescriptions have been proven mostly successful. Our concern is if the original seed application should be only successful enough to provide 'short term' ground cover stabilization for release of our ADEM permit, but not provide the long term ground cover that we always strive to achieve (or that you may desire for the following spring and summer and onward). We could not replant with a winter mix of wheat, rye, etc. until late Fall 2013, and our site maintenance would then be restricted to repairing any washes on the slopes, replacing silt fences, installing haybales, adding riprap to structures, etc., that may be damaged by

heavy rainfall events. If this should occur, would the USFWS replant as required with a seed mixture of your choosing? In the event of a poor initial ground cover stand, we might be forced to begin planting the Long Leaf Pines in the winter of 2014. This could actually benefit the tree survival, especially when the wheat and rye become dormant in the spring.

We realize that your review could take several weeks or more. However, we did want to give you sufficient notice on the timber cutting process so that your forester can coordinate with the timber cutting contractor to schedule his men and equipment to enable timber removal prior to our construction start up.

Finally, Michael is working with our Planning and Maintenance staff to initiate the NEPA requirements for the next phase of our Piper AML Project which will include the last remaining section(s) of highwall. We should have that information to you by April 1, 2013.

Sincerely,

C. Williams

Chuck Williams
State Mine Land Reclamation Supervisor

PROJECT: Piper II

STATE OF ALABAMA
CONSENT FOR RIGHT-OF-ENTRY (CONSTRUCTION)

I/We, the owner(s) of the following described property:

Access to and construction of approximately 35 acres to eliminate 3,750 linear feet of dangerous highwall and its associated features contained therein for purposes of mitigation of the dangers associated therewith. More specifically a portion of the project site containing 18 acres located in the SW ¼ of Section 2, identified as Tax Map Parcel No. 1001020000001000; a portion of the project site containing 12 acres located in the SE ¼ of the SE ¼ of Section 3, identified as Tax Map parcel No. 1002030000001000; and a portion of the project site containing 5 acres located in the N ½ of the NE ¼ of Section 10, identified as Tax Map Parcel No. 1002100000001000, all in Township 24 North, Range 10 East, Bibb County, alabama. All as per the Project Realty Map incorporated hereby referenced.

do hereby grant the State of Alabama Department of Labor (ADOL), its agents, employees and contractors, the right to enter upon the above-described property to do all things necessary to protect the public health, safety and general welfare by reclaiming lands adversely affected by past mining practices. The right to enter upon land for the purpose of reclamation is granted to the Department by the Code of Alabama, 1975, Section 9-16-126.

In consideration of the benefits which are expected to accrue as a result of the reclamation , I/we give the consent to enter upon the above-described property for the length of time necessary to complete the reclamation work and provide maintenance on the site for a period of two years following the completion of the reclamation work subject to my/our continued ownership and use of the property.

I/We understand and acknowledge that the success of the project cannot be warranted, and that the proposed work may not accomplish the intended result. I/We also understand and acknowledge that the Department bears no responsibility or liability for any mine-related damage to the property (or improvements thereon) which occurred prior to, or which might occur during or after the reclamation. Persons contracted by the Department to perform reclamation work are required to carry comprehensive liability insurance. I/We understand and acknowledge that the Department is not authorized to repair structures which have suffered mine-related damage.

I/We understand and acknowledge that the execution of this Consent for Right of Entry does not obligate the Department to perform any part of the contemplated or proposed reclamation work.

In giving my/our consent to this entry, I/we do not waive any rights conferred upon me/us by virtue of the language contained in the Code of Alabama, 1975, Sections 9-16-120 through 9-16-135

IN WITNESS HEREOF, the Owner(s) or authorized representative has caused this Consent for Right of Entry to be executed this _____ day of _____.

PART II

PIPER II

ABANDONED MINE LAND RECLAMATION PROJECT

BIBB COUNTY, ALABAMA

Prepared By:
Alabama Department of labor
Inspections Division
Abandoned Mine Land Reclamation Program
11 West Oxmoor Road, Suite 100
Birmingham, Alabama 35209

TABLE OF CONTENTS

NOTE: Instructions to Bidders, General Conditions and Additional Requirements for Federally Assisted Construction Contracts are contained in Part I of the Contract Documents and are considered part of the contract.

SUPPLEMENTARY CONDITIONS

SUPPLEMENTARY CONDITIONS

1. TIME

Unless modified in writing by the STATE MINE LAND RECLAMATION SUPERVISOR, the work in this contract shall be completed within one hundred (100) work days. A work day is herein defined as any day during the contract period, excluding Saturdays (unless approved by the DEPARTMENT), Sundays and holidays are specified in Article 6.3 of the General Conditions, where weather and field conditions are such that work could be performed, as determined by the PROJECT MONITOR. On days where weather and field conditions limit a normal work day, the day will be considered a work day if five (5) or more hours of work have been performed or could have been performed, as determined by the PROJECT MONITOR. In order for any work to be performed on a Saturday, a request by the CONTRACTOR to the PROJECT MONITOR must first be made no later than the end of the day on the preceding Wednesday. Notification for approval or disapproval of requested Saturday work will be given verbally by the PROJECT MONITOR before the end of the day on the preceding Friday. Approval for Saturday work will be given only when arrangements for a qualified PROJECT MONITOR can be scheduled to observe the Saturday work, and weather and construction logistics permit such work. In every case where Saturday work is requested by the CONTRACTOR and approved, it will be considered a work day where it has been determined by the PROJECT MONITOR that five (5) or more hours of work have been or could have been performed.

Any reference to day(s), unless specifically indicated as a work day, refer to continuous time calendar days.

2. FAILURE TO COMPLETE WORK WITHIN THE CONTRACT TIME

Should the CONTRACTOR, or in case of default, the Surety, fail to complete the work within the time stipulated in the contract, a deduction for each work day that any work shall remain incomplete, in the amount indicated by the Liquidated Damages Schedule shown below, shall be deducted from any monies due the CONTRACTOR. Liquidated damages assessed as provided in these specifications is not a penalty, but is intended to compensate the DEPARTMENT for increased time in administering the contract, supervision, inspection and engineering, particularly that engineering and inspection which requires maintaining normal project engineering forces for a longer time than originally contemplated when the contract period was agreed upon in the contract.

SCHEDULE OF LIQUIDATED DAMAGES

ORIGINAL CONTRACT AMOUNT		**CHARGE PER DAY**
More Than	To & Including	
$ 0	$ 25,000	$ 45.00
25,000	50,000	75.00
50,000	100,000	110.00
100,000	500,000	150.00
500,000	1,000,000	225.00
1,000,000	2,000,000	300.00

3. PAYMENT

Payment for the work will be made in accordance with the procedures of Article 12, Paragraph 12.1.3 in the General Conditions and Article 27 of the Special Provisions of Part II of the Contract Documents pertaining to the Piper II project.

SPECIAL PROVISIONS

SPECIAL PROVISIONS INDEX

SPECIAL PROVISIONS

1. LOCATION

The Piper II Abandoned Mine Land Reclamation Project is located in the SW ¼ of Section 2, the SE ¼ of the SE ¼ of Section 3, and the N ½ of the NE ¼ of Section 10, Township 24 North, Range 10 East, Bibb County, Alabama.

1. SCOPE OF WORK

2.1 It is the intent of the Piper II AML Reclamation Project to reclaim a dangerous highwall left from previous mining activities. The acreage to be reclaimed is approximately thirty-five (35) acres. The site will be reclaimed by using onsite spoil material to backfill the dangerous highwall. The dangerous highwall totals three thousand, seven hundred, fifty (3,750) feet in length and averages approximately eighty (80) feet in height. Drainage ditches will be constructed at the locations shown on the plans. Stakes haybales and riprap checkdams will be used to control sediment. Various erosion control devices such as riprap checkdams, silt fence, staked haybales, erosion control blanket, sediment control logs and other devices shown in the plans will be utilized during construction.

2.2 Revegetation operations will be completed on this project once all grading operations have been completed and approved by the PROJECT ENGINEER and PROJECT MONITOR. Revegetation operations applies to all items and phases of site revegetation including final grading/smoothing, application of lime and fertilizer, seedbed preparation, seeding, hydroseeding (if applicable) and mulching. The entire site will be revegetated immediately upon completion of all grading activities. The only delay in the revegetation operations would be from current weather conditions and/ or projected

temperatures and rainfall in the upcoming weeks. The PROJECT ENGINEER and PROJECT MONITOR will determine whether conditions are acceptable for performing the revegetation operations.

2.3 A stormwater discharge permit has been obtained by the DEPARTMENT from ADEM. ADEM issued the DEPARTMENT a General NPDES Permit with an assigned number of ALR107849. Before any grading or construction activities begin on the project, the stormwater discharge permit identification sign and freeze proof rain gauge marked in tenths of an inch shall be installed. All specified erosion control devices such as Types A & B silt fences, staked haybales, sediment control logs, and riprap checkdams shall be installed and maintained according to the Alabama Handbook on Construction BMP's. Before any clearing, grading or construction activities begin, all erosion control devices previously described shall be placed as shown on Sheets 2 & 3 of the plans to prevent sediment from leaving the site. The CONTRACTOR shall maintain the erosion control items at the locations shown on the plans and at other locations specified by the PROJECT MONITOR, if those original locations are rendered ineffective or cannot be maintained properly.

2.4 The CONTRACTOR shall be responsible for safeguarding all utility lines (surface or underground), especially those lines (gas and water lines) as well as any power lines and guy wires located within the construction limits (or access thereof). The CONTRACTOR shall be responsible for coordinating any project activity where such lines and/or structures may be involved. The CONTRACTOR shall exercise care when working in the vicinity of utility poles and guy wires and abide by all safety rules and regulations of the utility companies. In the event of damage to any utility line (surface or underground) by the CONTRACTOR, his agents, employees or subcontractors, the CONTRACTOR shall bear the cost of repair or replacement at the option of the utility company, or the private landowner, as

applicable. The CONTRACTOR must also assume any liability for consequential loss or damage arising from service interruption and/or lack of responsibility for repairing the line(s).

2.5 The CONTRACTOR shall take all responsibility and abide by all applicable laws and regulations, for working under and around the utility lines adjacent to and within the project site. The CONTRACTOR shall provide a spotter on the ground to watch for equipment operators while they work under the lines and around the poles and guy wires. The CONTRACTOR shall affix a warning label (provided by the DEPARTMENT; see Drawing Section) on the dash of each piece of equipment operating on the project.

2.6 On January 24, 2013, The U.S. Department of Interior - Office of Surface Mining determined that the Piper II AML Reclamation Project adequately addresses the environmental issues and impacts associated with this project and based on the analysis of the environmental assessment document they have determined that reclamation would not significantly affect the quality of the human environment. Pursuant to Section 4-160-50D.3 of the Federal Assistance Manual, the DEPARTMENT is authorized to proceed with the project. On June 3, 2008, The U.S. Fish and Wildlife Service issued a Sec. 7 Review on this project and on July 10, 2012, submitted an archeological review of this area to the Alabama Historical Commission for this project. The Alabama Historical Commission reviewed the findings of the archeological study for this project and sent a letter dated August 2, 2012, stating that they were in agreement with the proposed project which would not affect any cultural resources listed on or eligible for the National Register of Historic Places (NRHP). The Alabama Department of Conservation and Natural Resources has included this project in its Categorical Exclusions Determination dated December 28, 1998, provided that the

appropriate erosion control methods are used to eliminate siltation. The Alabama Department of Environmental Management has included this project in its Categorical Exclusions Determination dated July 24, 1998, provided that a stormwater discharge permit is obtained, if needed. The DEPARTMENT obtained a stormwater discharge permit dated August 31, 2011, from ADEM> The U.S. Army Corps of Engineers has reviewed this project and determined that a Nationwide Permit 37 is required; hence, the DEPARMENT applied for and obtained a NWP 37 dated September 17, 2012, from the U.S. Army Corps of Engineers. Consultation letters from the U.S. Department of the Interior – Office of Surface Mining, the U.W. Fish and Wildlife Service, the Alabama Department of Conservation and Natural Resources, the Alabama Historical Commission, the Alabama Department of Environmental Management and the U.S. Army Corps of Engineers are included in the Consultation Letters section of these contract specifications.

2.7 Ground control points, bench marks, property corners and property line markers shall not be disturbed by the CONTRACTOR until those points or markers are relocated and referenced by AML personnel. The CONTRACTOR shall be responsible for employing a licensed land surveyor for the purpose of re-establishing any established points which are not protected in accordance with these provisions.

2.8 All estimated quantities shown in the Principal Items of Work are provided to aid the CONTRACTOR in submitting bid prices and <u>are not guaranteed by the DEPARTMENT.</u>

3. BEGINNING WORK

3.1 The CONTRACTOR shall begin work at the project within ten (10) days after he receives the fully executed contract. The time schedule for completion of the project shall begin ten (10) days from the date of the contract. The completion date will fall on the close of the work day one hundred (100) work days later.

3.2 The CONTRACTOR shall notify the Abandoned Mine Land Field Office in Birmingham of the date on which he wants to schedule a pre-construction conference in order to begin construction. A pre-construction conference mush be held before construction begins. The CONTRACTOR, RESIDENT SUPERINTENDENT, AML CONSTRUCTION SUPERVISOR, PROJECT ENGINEER and PROJECT MONITOR shall review the plans and specifications onsite at this time.

3.3 All specified erosion control devices, the stormwater discharge permit sign, rain gauge and construction signs must be placed and approved by the PROJECT MONITOR before any grading or clearing can begin. During the life of the project, it shall be the CONTRACTOR's responsibility to ensure that all erosion control devices are in place, maintained, and functioning properly as required by the PROJECT MONITOR. This includes regular and periodic excavation of sediment collected in front of riprap checkdam(s) and replacing silt fences and haybales as needed to prevent offsite sedimentation.

3.4 The CONTRACTOR shall keep a competent SUPERINTENDENT on the job site at all times while the work is in progress. The SUPERINTENDENT shall supervise the work in accordance with the plans and specifications and carry

out the instructions of the PROJECT MONITOR. The SUPERINTENDENT shall keep a copy of the plans, Parts I and II of the Contract Documents and the NPDES General Permit for stormwater run-off in his possession at all times while the work is in progress.

4. CLEARING

4.1 Clearing shall consist of removing, burning and disposing of all damaged vegetation and debris from the surface of the reclamation site and along the access road. The CONTRACTOR shall be responsible for collecting and removing any household trash and debris discovered on the project site by hauling that material to an approved landfill facility. A receipt shall be furnished to the PROJECT MONITOR showing that the CONTRACTOR properly disposed of the household trash and/or debris at the landfill facility. "No Burn" orders issued by the Bibb County Office of the Alabama Forestry Commission shall be strictly enforced. The burning of rubber tires is prohibited as per ADEM requirements. The CONTRACTOR will be required to obtain and pay for the cost of a permit from the Bibb County Office of the Alabama Forestry Office to conduct the burning of cleared material.

4.2 The CONTRACTOR will be required to furnish a trench burning machine and provide the equipment and personnel necessary to dig the trench and set up and operate the trench blower equipment. Brush, debris and stumps shall be burned completely, because burying of cleared material will not be allowed on this project site.

4.3 The PROJECT MONITOR may adjust the planned clearing limits as necessary in order to blend the disturbed areas into the natural topography and preserve existing vegetation along the periphery of the project.

4.4 Cut and fill areas shall be cleared of all trees, brush and undergrowth. Tree stumps cut off one (1) foot or less above the ground may be left in fill areas that are located above the water table. Stumps shall be removed from fill areas which have standing water or are located adjacent to water seepage areas. Standing live trees that have been damaged during construction shall be treated with an approved tree wound dressing immediately after clearing operations have been completed.

4.5 All cleared material (i.e. trees, brush and stumps) shall be disposed of by burning onsite in an area segregated from existing coal stockpiles, coal seams, manholes, gas lines, gas wells, gas/water line valve housings, and other flammable materials. The location, time of burning and size of each brush pile shall be approved by the PROJECT MONITOR prior to any brush pile burning activities. The CONTRACTOR shall limit the size and number of brush piles being burned. The CONTRACTOR shall clear out an area of approximately fifty (50) feet in radius or larger around each brush pile as directed by the PROJECT MONITOR. Clearing around each brush pile shall be completed before each pile is ignited. The CONTRACTOR shall push up each pile a minimum of three (3) hours before the end of the work day and allow the piles to burn down before leaving the site. No fires are to be left unattended overnight by the CONTRACTOR. Any stumps remaining after a diligent effort to burn shall be hauled to an approved landfill facility and properly disposed of there.

4.6 Any damage to adjacent property or structures from fires caused by the CONTRACTOR's brush burning operations shall be completely repaired by the CONTRACTOR as directed by the PROJECT MONITOR, and/or fully compensated for at the CONTRACTOR's expense. This includes any clearing required to remove damaged vegetation, repair of fire related damage

or disturbance (i.e. firebreaks, roads, ditches, etc.), and revegetation of all disturbed areas. No additional compensation will be paid to the CONTRACTOR for this work.

4.7 The CONTRACTOR shall be responsible for ensuring that any burn permits required to conduct the work have been obtained prior to beginning any work. The CONTRACTOR shall also be responsible for complying with all local, State and Federal laws, ordinances and regulations applicable to the burning of cleared material. The PROJECT MONITOR must be furnished with evidence of all necessary permits before any burning begins and regularly throughout the burning process.

4.8 If a burn permit cannot be obtained from the Bibb County Office of the Alabama Forestry Commission due to drought or air quality conditions, the CONTRACTOR shall haul all brush, trees, and debris which were to be burned to a local approved landfill or have the cleared material ground and hauled to a facility that uses that type of material.

4.9 During the clearing operation, the CONTRACTOR shall take proper precautions to ensure that bench marks, property corners and property line markers are not disturbed. Bench marks, property corners and property line markers shall be flagged and referenced by AML personnel. The CONTRACTOR shall consult AML personnel before doing excavation and grading work in areas that have property corners and property line markers. The CONTRACTOR shall assist the AML personnel in removing and saving any markers. If any markers are destroyed before being referenced by AML personnel, then the CONTRACTOR shall replace them at his cost. Once the property corners and property line markers have been referenced by the AML personnel, the CONTRACTOR may proceed with excavation work.

4.10 The CONTRACTOR will be required to grade, backfill and improve as needed two access roads to the project site. The southernmost access road will require backfilling and installing a twenty-four (24) inch diameter corrugated plastic (N-12) pipe. Crushed stone will be added to the roadway surface as needed to provide traction for the CONTRACTOR's equipment and vehicles as they enter and leave the project site. A crushed stone entrance will prevent tracking of mud and debris onto the paved surface. Grading of the existing access roads on this project has not been included in the Principal Items of Work. Thus, it shall be the responsibility of the CONTRACTOR to cover the cost of this work in his bid price for mobilization.

4.11 Clearing within the work area on this project has not been listed as a line item in the Principal Items of Work. Thus, it shall be the responsibility of the CONTRACTOR to cover the cost of this item of work in his bid price for unclassified excavation, as described in Article 5 of these Special Provisions.

5. UNCLASSIFIED EXCAVATION

5.1 Unclassified excavation includes the following: the removal of cleared material (Clearing Article 4); the removal of rock and fill material from specified cut areas; and then hauling, backfilling, compacting and grading of those materials to the grades shown on the Site Grading Plan. Unclassified excavation also includes performing finished ground preparation, as well as other items discussed in this article. Before excavation begins, the CONTRACTOR shall be responsible for locating and protecting all utilities that may be buried along and under the access road and within the project limits.

5.2 In the event there is less embankment required than originally planned, or if solid rock outcroppings occur in cut areas, excavation may be adjusted with

field grades approximating design grades. Any deviation between design and field grades shall require approval from the PROJECT ENGINEER. Finished grades along the project limits will be blended with the existing terrain as directed by the PROJECT MONITOR.

5.3 All drainage ditches shall be graded as shown in the plans. The bottom and lower ten (10) feet of the side slopes of each ditch shall be compacted with three complete passes of a D-8 Caterpillar dozer or equivalent-sized, heavy equipment after final grading and shaping have been completed and approved by the PROJECT MONITOR. All drainage ditches that have been damaged by stormwater run-off shall be repaired as stated above for the final inspection.

5.4 All drainage ditches that have riprap checkdams shall have the sediment in front of the checkdams removed before the final inspection. The sediment shall be removed and spread out uniformly on the adjacent slopes during the clean out process as directed by the PROJECT MONITOR. If any drainage ditch has both erosion control blanket and riprap checkdams, then the CONTRACTOR shall use extreme care as not to damage the blanket while removing the sediment from the checkdams. The checkdams shall be repaired if they are breached and the erosion control blanket replaced if it is damaged. All grading or regrading of drainage ditches shall be considered a part of Unclassified Excavation.

5.5 Material used to backfill the highwall shall be placed in three foot thick, horizontal and uniform layers all the way to the face of the highwall. Each three foot layer shall be compacted perpendicularly to the highwall for the entire depth of the backfill except for the upper twenty (20) feet. The upper twenty (20) feet of the highwall shall also be backfilled and compacted in three foot thick, horizontal and uniform layers all the way to the face of

the highwall; however, the compaction here shall be parallel to the highwall for a minimum distance of two dozer widths away from the face of the highwall, all the way to the top. All compaction of backfill material at the highwall shall take place along the entire length of the highwall. All compaction of backfill material, whether performed perpendicular or parallel to the highwall, shall be accomplished with four complete passes of a D-8 Caterpillar dozer or equivalent sized tracked equipment. No highwall backfill material shall be taken from the top of the highwall except as noted on the cross sections. Any highwall backfill material taken from above the highwall shall be compacted in the same manner as described above. In the event of unusual or extraordinary circumstances, these compaction requirements may be modified by the PROJECT ENGINEER.

5.6 Any displacement of graded material (cut or fill) which results in settling, slumping or for any other reasons which occurs within one year after completion of construction shall be repaired by the CONTRACTOR. This repair shall include revegetating all areas disturbed during the repair process (see revegetation specification in Articles 21, 22 and 23) and replacing any slump related damage to erosion control materials, including Type B silt fence, staked haybales, erosion control blanket and limestone riprap, as directed by the PROJECT MONITOR. No additional compensation will be paid to the CONTRACTOR for this work. The one - year period shall commence on the date of the final inspection upon which the DEPARTMENT formally acknowledges acceptance of the project.

5.7 Ditches shall be laid out and excavated in the finished slopes at the locations shown on the plans. The CONTRACTOR shall maintain a consistent, uniform design depth throughout the length of the ditches, and shall ensure that they do not deviate from their design configuration and slope.

5.8 All backfill material shall be obtained from existing spoil piles located below the highwall. No backfill material shall be obtained from above the highwall, except as shown in the cross sections.

5.9 Diligent efforts shall be made to keep the access road and all public roads adjacent to the project site clear of mud and debris during construction activities. The CONTRACTOR shall remove any such mud and debris on public roads as well as repair, at his own expense, any road damage caused by transporting, operating or loading and unloading the equipment. Crushed limestone shall be spread, as needed, on the access road(s), and at other locations as needed throughout the project duration and as directed by the PROJECT MONITOR.

5.10 At the direction of the PROJECT MONITOR, the CONTRACTOR shall stockpile any topsoil or best material available to plate finished slopes and ditches.

5.11 Finished ground preparation shall consist of minor grading, smoothing to uniform contours and compacting by "tracking in" the finished surface of all disturbed or constructed slopes by successive passes of heavy tracked equipment equivalent in size to a D-8 Caterpillar dozer at frequent and regular intervals along the slopes. The passes shall be made parallel to the slope or as approved by the PROJECT MONITOR. The CONTRACTOR shall smooth-grade all sheet erosion, rills, gullies and washes. The graded areas must be approved by the PROJECT MONITOR for smoothness, compaction, slope and grade, and shall be free of all boulders, rocks, sticks, roots and other debris before final inspection. The cost associated with finished ground preparation shall be included in the bid price for Unclassified Excavation.

5.12 The CONTRACTOR shall be responsible for providing a construction site free from dust pollution caused by trucks entering the project site across access roads and/or trucks, tractors, scrapers or other heavy construction equipment performing construction activities on the project site. The CONTRACTOR shall provide a source of the water as well as providing the equipment capable of hauling and applying the water to the construction site and access or haul roads. The CONTRACTOR shall use erosion control devices to protect the construction areas as well as the adjacent properties during these activities. Any damage caused by air pollution shall be the responsibility of the CONTRACTOR to repair, replace or correct to the satisfaction of the DEPARTMENT. The DEPARTMENT will halt grading activities if adequate dust control measures are not provided by the CONTRACTOR at the site. The CONTRACTOR shall include the cost of dust control on the project site in his bid price for Unclassified Excavation.

5.13 Unclassified excavation is considered a lump sum item. The CONTRACTOR shall be paid for the quantity shown in the Principal Items of Work. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit bid price. When requesting partial payment for the work, the CONTRACTOR shall be paid for quantity of unclassified excavation moved during the construction period, limited to the amount shown in the lump sum bid.

6. EROSION AND SEDIMENT CONTROL MEASURES

6.1 The CONTRACTOR shall be responsible for abiding by all of the rules and regulations of the stormwater discharge permit issued by ADEM. The CONTRACTOR will be responsible for installing and maintaining all forms of erosion control devices as well as making preparations for inclement weather

as forecasted by local meteorologists. Best Management Practices (BMP's) shall be incorporated into the daily activities of the CONTRACTOR's work at the project site.

6.2 The CONTRACTOR shall have all types of erosion control items and devices such as, but not limited to, staked haybales, sediment control logs, and Type A and Type B silt fences, available onsite on a day to day basis in order to replace, repair or add to existing structures.

6.3 The CONTRACTOR will be required to protect all existing drainageways and culverts adjacent to the project limits as well as the existing roadside ditches along the paved roads. The CONTRACTOR shall install riprap checkdams, staked haybales, sediment control logs and silt fencing prior to construction activities at the site.

6.4 Type A and Type B silt fencing shall be installed on the project site at the locations shown on the plans. Riprap checkdams shall be installed (as needed) upstream of the silt fences in the main drainage areas to check erosion and prevent damage to the silt fences.

6.5 Temporary earthen berms with a riprap core shall be constructed at the base of the highwall downstream of the construction grading and backfilling operations to control runoff and prevent sediment from leaving the site. The details for the temporary earthen berm may be found on Sheet 11 of the plans.

6.6 The CONTRACTOR shall be responsible for protecting all drainage outlets from the site to the natural drainageways. Staked haybales, sediment control logs, Type A and Type B silt fencing and other erosion control items shall be

placed in drainage ditches, prior to pumping any impoundments in order to prevent sediment from impacting the offsite drainageways. The CONTRACTOR shall repair or correct (at his expense) any problem arising with these structures regardless of what created the problem.

6.7 The CONTRACTOR and/or his personnel shall be responsible for maintaining the entrance to the access roads and controlling mud, debris and drainage associated with the access roads along its length. Riprap crossings, corrugated plastic pipe, water bars, erosion control blanket, etc. may be used to eliminate erosion problems around the access roads. Water bars shall be directed to the side of the access road that passes through a drainage structure. All drainage leaving the site shall be filtered through riprap checkdams, staked haybale checkdams, or silt fence structures. It shall be the CONTRACTOR's responsibility to see that the erosion and sediment control structures are in place and functioning properly on a week to week or day to day basis especially when severe weather is forecast.

6.8 The CONTRACTOR shall begin installing finished erosion control devices as soon as the grading of the backfill material has been completed in those areas. Finished earthen berms may be constructed in areas where final grading has been completed and the application of temporary seeding is not feasible because of time constraints. Finished earthen berms will be constructed using in place spoil of the finished slopes to build the berms. Class I limestone riprap will be used in the core of the earthen berm and encased with non-woven filter fabric. The finished earthen berm will be removed and the material placed and compacted back into the finished slopes, while the riprap will be used in a riprap-lined ditch or riprap checkdam at that location.

6.9 The CONTRACTOR will be required to cover finished slopes with temporary seeding and/or temporary mulching if those finished slopes will be left exposed to inclement weather conditions and unprotected for an extended period of time. Temporary mulching shall be applied at a rate of one ton per acre. The temporary seed mixture shall be applied at the corresponding rates for the current time of year based on the chart shown in Article 1.4 of the Technical Specifications. The type of mulching material used in the temporary mulching is shown in Article 2.1 of the Technical Specifications. Both items are listed as bid items in the Principal Items of Work.

6.10 Water bars used on finished slopes may be installed to protect the exposed slopes to inclement weather prior to the final revegetation operations. Water bar details are shown on Sheet 10 of the plans. Water bars built in finished slopes are listed as a bid item in the Principal Items of Work.

6.11 Silt fencing, staked haybales, sediment control logs and temporary riprap checkdams shall be left in place until those areas can be prepared for revegetation operations and permanent erosion control structures can be built in place.

6.12 Any damage to adjacent property caused by stormwater run-off flowing from work area of the project site shall be repaired by the CONTRACTOR at his own expense.

7. PIPE

7.1 Pipe shall consist of furnishing and installing the correct pipe size as indicated in the plans, providing couplings and other incidental materials, as well as performing all necessary excavating, backfilling, compacting, and cutting associated with its installation. The pipes in this article shall meet the requirements of Article 13 of the Technical Specifications.

7.2 Six inch corrugated plastic pipe (perforated and solid) shall be used in the French drain system that will be installed at the base of the highwall in certain areas where field conditions show evidence of water seepage coming from the highwall. The perforated pipe shall be used in the transverse (parallel to the highwall) and lateral runs (perpendicular to the highwall) of the French drain system. The last twenty feet of the lateral run will be solid pipe that empties out on to the riprap outfall of the French drain system. Six inch diameter corrugated plastic (perforated) pipe may be used in the riprap checkdams as shown on Sheet 10 of the plans.

7.3 Eighteen (18) inch and twenty-four (24) inch diameter corrugated plastic (N-12) pipes will be used in certain areas of the access roads where cross drains need to convey water and prevent washing and erosion. These pipes will also be used in the access roads onsite once construction activities have been completed.

7.4 PE pipes shall be laid in a trench with a side clearance of twenty-four (24) inches. The trench shall be backfilled with material which is free of rocks and stone fragments and is approved by the PROJECT MONITOR. The trench shall be backfilled in one foot layers and each layer shall be mechanically tamped. In backfilling around the pipe, both sides shall be backfilled simultaneously, beginning at the downstream and proceeding upstream.

7.5 Excavation for the pipes shall be considered as part of its installation and not part of the Unclassified Excavation described in Article 5 of these Special Provisions.

7.6 The six inch diameter perforated and solid corrugated plastic pipes and the eighteen (18) and twenty-four (24) inch diameter corrugated plastic (N-12)

pipes are considered variable quantity items. The CONTRACTOR shall be paid for the actual quantity of pipes installed and made ready for service. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit prices. When requesting partial payment for the work, the CONTRACTOR shall be paid for the actual linear feet of pipe(s) installed and backfilled during the construction period.

8. CONCRETE GROUT

8.1 Concrete grout shall consist of furnishing all labor, equipment, and concrete grout necessary to place concrete grout in and around the riprap, as needed, and directed by the PROJECT ENGINEER or PROJECT MONITOR. This includes any equipment, excavation or other incidental items necessary to construct grouted riprap ditches.

8.2 Concrete grout shall consist of a proportionate mixture of one part cement, and two and a half parts commercial concrete sand, by weight, batched from a central batch plant. The concrete grout shall be delivered to the job site in rotary mixer trucks with a slump from five to eight inches.

8.3 The concrete grout shall be transported and completely placed in the grouted riprap ditch within sixty (60) minutes after water is introduced to the dry cement mixture. No concrete grout shall be placed without written permission of the PROJECT MONITOR when the ambient air temperature is below thirty-five (35) degrees F., or below forty (40) degrees F. and falling.

8.4 Prior to placing the concrete grout, riprap shall be sprayed with water to avoid rapid moisture loss. When the ambient temperature is between 45 degrees F. and 70 degrees F., the riprap will not require any spraying with water prior to concrete placement.

8.5 A concrete pump or concrete buckets shall be used to deliver the grout to the ditch. The grout shall not be allowed to fall more than eighteen (18) inches from any container; nor shall the electric vibrators be used to "run" the grout in the ditch. The grout shall be hand worked between and around the riprap leaving the surface of the riprap exposed.

8.6 The surface of the grout shall be allowed to set to a semi-plastic state, then the complete length and width of the grouted ditch area shall be "broomed" perpendicular to the centerline of the ditch.

8.7 The concrete surface shall be protected in warm weather with wet burlap sacks or by covering the surface with polyethylene for a period of thirty-six (36) hours. In cold weather, the concrete surface shall be protected with concrete insulating blankets or with a six inch layer of hay between two layers of polyethylene, for a period of seventy-two (72) hours. The temperature of the concrete shall be maintained at 50 degrees F. or above during this seventy-two (72) hour period.

8.8 Original vendor's tickets showing the strength of the concrete grout, cubic yards delivered and the time water was introduced into the mixer shall be submitted to the PROJECT MONITOR for each batch delivered to the project, before placement begins.

8.9 Concrete grout is considered a variable quantity item. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit price. When requesting partial payment for the work, the CONTRACTOR shall be paid for the actual quantity of concrete grout installed during the construction period.

9. CRUSHED LIMESTONE

9.1 Crushed limestone shall consist of hauling, installing, compacting and grading crushed limestone and material to the grades shown in the plans. This includes any equipment or other incidental items necessary to perform the work.

9.2 Crushed limestone will be used on all access roads leading to the project area. The CONTRACTOR will be required to place crushed limestone periodically or as needed on the access road to gain entry to the project site during construction activities. ALDOT No. 57 limestone will be used as a base stone application but may be overlaid with No. 8910 limestone as needed when surface compaction is required.

9.3 ALDOT No. 1 limestone shall be used as the stone in the French drain system. A French drain system shall be installed at the base of the highwall and other areas as needed, when field conditions require the use of a French drain system.

9.4 Crushed limestone and ALDOT No. 1 limestone are considered variable quantity items. The CONTRACTOR shall be paid for the actual quantity installed, compacted and made ready for service. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit prices. When requesting partial payment for the work, the CONTRACTOR shall be paid for the actual tonnage of crushed limestone or ALDOT No. 1 limestone installed and compacted during the construction period.

10. RIPRAP

10.1 Riprap shall consist of furnishing, delivering, installing and constructing riprap checkdams, riprap-lined ditches, rock underdrains, and/or placing riprap in other areas as directed by the PROJECT MONITOR. This includes any equipment stabilization fabric, excavation and labor necessary to place the riprap as directed.

10.2 Class I (size 8" – 12") and Class II (size 12" – 18") limestone riprap shall be used on this project. The PROJECT MONITOR and PROJECT ENGINEER shall visit the quarry and select the size and type of riprap before any stone is delivered to the project. Riprap shall be placed in the areas shown on the plans and in the contract specifications as directed by the PROJECT MONITOR.

10.3 Riprap-lined ditches shall have a two feet deep by two foot wide toe wall at the inlet and outlet ends of the ditch. The toe wall shall extend the full width of the ditch and to the outer edge of the riprap-covered side slopes.

10.4 Riprap drainage structure will require geotextile fabrics placed as shown on the details for each structure. Stabilization fabric will be required in the riprap-lined ditch when the slope is greater than negative five percent (-5%). Non-woven filter fabric shall be used to line the riprap ditches on the slopes less than negative five percent (-5%). The cost associated for furnishing and installing the stabilization fabric and non-woven filter fabric is discussed in the articles for those items.

10.5 If field conditions warrant, Class I riprap may be used as an alternative in rock underdrains to alleviate underground water seepage in the backfilled slopes of the highwall. The CONTRACTOR shall use a backhoe to excavate a trench to

the depth of the water seepage and place Class I riprap in an envelope of non-woven filter fabric to convey the water to the ditch at the toe of the highwall slope. Class I riprap shall be placed in an eighteen (18) inch thick layer to construct the rock underdrain.

10.6 Original vendor's tickets, from a certified vendor's scale, showing the producer, size and gross, tare and net weights of the stone shall be submitted to the PROJECT MONITOR to verify the grade and weight of stone used on the project. These tickets shall be required for payment of riprap work.

10.7 Class I and Class II riprap are considered variable quantity items. The CONTRACTOR shall be paid according to certified vendor's tickets for riprap delivered to the project and incorporated into structures shown on the plans and placed at other locations directed by the PROJECT MONITOR. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit prices. When requesting partial payment for the riprap items of work, the CONTRACTOR shall be paid for the quantity of each type of riprap installed on the project during the construction period.

11. STAKED HAYBALES

11.1 Staked haybales shall consist of furnishing and installing rectangular haybales with stakes at the locations designated on the Site Grading Plans and other locations as directed by the PROJECT MONITOR. Any excavation associated with the installation of staked haybales shall be included in the unit price for staked haybales. Haybales used on the project shall meet the standards described in Article 3 of the Technical Specifications.

11.2 Haybales shall be placed with the long dimensions perpendicular to the flow of surface water with their wide dimension against the ground. Bales shall be

placed end-to-end, pushed together and secured with two wooden stakes, as shown on the staked haybale detail.

11.3 Each stake shall be driven at least twelve (12) inches into the underlying soil. The stake shall be driven deep enough to leave the top of the stake flush with the bale top.

11.4 Staked haybales shall be installed on top of the existing ground or keyed into the existing ditches as designated on the Site Grading Plans and in areas designated by the PROJECT MONITOR to help prevent offsite sedimentation during construction. Staked haybales may be used to help reinforce silt fences in areas where concentration of surface run-off or heavy silt buildup is expected. Haybales shall be maintained and/or replaced during the construction period as directed by the PROJECT MONITOR.

11.5 Staked haybales are considered a variable quantity item. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit price. When requesting partial payment for the work, the CONTRACTOR shall be paid for the actual quantity of staked haybales properly installed and made ready for service during the construction period.

12. SEDIMENT CONTROL LOGS

12.1 Twelve (12) inch diameter sediment control logs may be used in places where staked haybales would have been used, i.e. in ditches, in areas around riprap checkdams that are being used for pumping operations, around pipe inlets to protect the pipe from sediment laden run-off and in existing ditches to protect natural drainageways. The sediment control logs to be used are specified in Article 4 of the Technical Specifications.

12.2 Sediment control logs shall be installed so that the length of the logs are laid perpendicular to the flow of water. They shall be staked with wooden stakes (size: 1 inch by 2 inches by 36 inches) on the downstream side making certain to intercept some of the netting as shown on Sheet No. 11 of the construction plans. They shall be staked a minimum of three foot on centers and every two feet when high water concentrations are expected.

12.3 Sediment control logs are considered a variable quantity item. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit price. When requesting partial payment for the work, the CONTRACTOR shall be paid for the actual quantity of sediment control logs properly installed and made ready for service during the construction period.

13. EROSION CONTROL BLANKET

13.1 Erosion control blanket shall consist of furnishing the blanket, six inch wooden stakes, fertilizer, lime, seed and labor required for installation at the locations shown on the plans. The erosion control blanket to be used is specified in Article 5 of the Technical Specifications.

13.2 Erosion control blanket shall be placed at locations shown on the plans after finished ground preparation has been completed. The CONTRACTOR shall apply lime, fertilizer and seed beneath the blanket before it is installed. The seed shall be applied at the required rate stated in Article 1.3 of the Technical Specifications. The lime shall be applied at the rate of six tons per acre, and the fertilizer (13-13-13) at seven hundred fifty (750) pounds per acre. The seedbed shall be prepared using onsite grading equipment such as a front end loader or small dozer.

13.3. Erosion control blanket shall have a minimum width of six and a half feet and shall be placed in terraces and drainage ditches as shown on the plan details. The side and end laps of the blanket material installed in the terrace ditches shall be a minimum of two inches and six inches respectively. The installation of the blanket shall begin from the upstream end and shall be unrolled in the direction of the flow of water.

13.4 The upstream terminal end shall be anchored in a six inch square trench and staked every eighteen (18) inches on centers. The backfilled trench shall be compacted to the density of the surrounding soil. At intervals of thirty (30) feet measured from the upstream terminal end and proceeding downstream, six inch square checkslots shall be cut into the bottom and side slopes of the terrace or drainage ditches perpendicular to the drainage flow. The blanket material shall be folded into the six inch checkslots as represented in the checkslot anchor detail shown in the plans. The blanket material shall be staked in the center and at the overlapped edged prior to backfilling and compacting the checkslots. Then the backfilled trench shall be compacted to the density of the surrounding soil.

13.5 Erosion control blanket shall be staked in place along all sides, side laps and end laps. Upstream end laps shall extend over the downstream laps by six inches. All sides and side laps shall be staked to a minimum of four feet on centers from the beginning to the end. All ends and end laps shall be staked at each corner and laterally at sixteen (16) inch intervals along the lapped edge. A single row of stakes will be required along the center of each roll width, alternating in sequence with the side and side lap staking. The stakes shall be driven vertically into the ground through the blanket material using a rubber mallet or hammer.

13.6 The CONTRACTOR shall be paid for the linear feet of erosion control blanket installed in terraces and ditches as measured by the PROJECT MONITOR based on a minimum width of six and a half feet. Terminal ends, checkslots and sidelaps shall not be included in the measurements to determine the linear footage of erosion control blanket installed on the project. The CONTRACTOR will only be paid for the actual linear feet installed on the project.

13.7 Erosion control blanket is considered a variable quantity item. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit price. When requesting partial payment for the work, the CONTRACTOR shall be paid for the actual quantity of erosion control blanket installed in accordance with the plans and specifications and made ready for service during the construction period.

14. SLOPE PROTECTION BLANKET

14.1 Slope protection blanket shall consist of furnishing the blanket, six inch wooden stakes (only), fertilizer, lime, seed and labor required for installation at the locations shown on the plans. The slope protection blanket to be used is specified in Article 6 of the Technical Specifications.

14.2 Slope protection blanket shall be placed at location shown on the plans after finished ground preparation has been completed. The CONTRACTOR shall apply lime, fertilizer and seed beneath the blanket before it is installed. The seed shall be applied at the required rate stated in Article 1.3 of the Technical Specifications. The lime shall be applied at the rate of six tons per acre, and the fertilizer (13-13-13) at seven hundred and fifty (750) pounds per acre. The seed bed shall be prepared using onsite grading equipment such as a front end loader or small dozer.

14.3 Slope protection blanket shall have a minimum width of six and a half feet and shall be placed on the finished slopes at the locations shown on the plans. The upslope edge of the blanket material shall be installed in a six inch by six inch trench. The trench may be hand dug or mechanically dug using a trenching machine or other technique that is approved by the PROJECT MONITOR. Six inches of the blanket material shall be placed and pinned in the trench. The trench shall be backfilled with the material removed from the trench and the material compacted to the density of the surrounding ground.

14.4 Slope protection blanket shall be staked in placed along lower side and at the center. A single row of stakes will be required along the center and lower edge of each roll width, alternating in sequence from the center to the edge at a six foot spacing. The stakes shall be driven vertically into the ground through the blanket material using a rubber mallet or hammer.

14.5 Slope protection blanket is considered a variable quantity item. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit price. When requesting partial payment for the work, the CONTRACTOR shall be paid for the actual quantity of slope protection blanket installed in accordance with the plans and specifications and made ready for service during the construction period.

15. PERMANENT EROSION CONTROL BLANKET

15.1 Permanent erosion control blanket shall consist of furnishing the blanket, six inch wooden stakes, fertilizer, lime, seed and labor required for installation at the locations shown on the plans. The permanent erosion control blanket to be used is specified in Article 7 of the Technical Specifications.

15.2 Permanent erosion control blanket shall be placed at locations shown on the plans after finished ground preparation has been completed. The CONTRACTOR shall apply lime, fertilizer and seed beneath the blanket before it is installed. The seed shall be applied at the required rate stated in Article 1.3 of the Technical Specifications. The lime shall be applied at the rate of six tons per acre, and the fertilizer (13-13-13) at seven hundred fifty (750) pounds per acre. The seedbed shall be prepared using onsite grading equipment such as a front end loader or small dozer.

15.3. Permanent erosion control blanket shall have a minimum width of six and a half feet and shall be placed in drainage ditches as shown on the plan details. The side and end laps of the blanket material installed in the ditches shall be a minimum of six inches and six inches respectively. The installation of the blanket shall begin from the upstream end and shall be unrolled in the direction of the flow of water.

15.4 The upstream terminal end shall be anchored in a six inch square trench and staked every eighteen (18) inches on centers. The backfilled trench shall be compacted to the density of the surrounding soil. At intervals of thirty (30) feet measured from the upstream terminal end and proceeding downstream, six inch square checkslots shall be cut into the bottom and side slopes of the terrace or drainage ditches perpendicular to the drainage flow. The blanket material shall be folded into the six inch checkslots as represented in the checkslot anchor detail shown in the plans. The blanket material shall be staked in the center and at the overlapped edged prior to backfilling and compacting the checkslots. Then the backfilled trench shall be compacted to the density of the surrounding soil.

15.5 Permanent erosion control blanket shall be staked in place along all sides, side laps and end laps. Upstream end laps shall extend over the downstream laps by six inches. All sides and side laps shall be staked to a minimum of three feet on centers from the beginning to the end. All ends and end laps shall be staked at each corner and laterally at twenty-four (24) inch intervals along the lapped edge. A single row of stakes will be required along the center of each roll width, alternating in sequence with the side and side lap staking. The stakes shall be driven vertically into the ground through the blanket material using a rubber mallet or hammer. A typical staking pattern identified as "Type E" shown in Mirafi specifications may be used as well.

15.6 The CONTRACTOR shall be paid for the linear feet of permanent erosion control blanket installed in ditches as measured by the PROJECT MONITOR based on a minimum width of six and a half feet. Terminal ends, checkslots and sidelaps shall not be included in the measurements to determine the linear footage of erosion control blanket installed on the project. The CONTRACTOR will only be paid for the actual linear feet installed on the project.

15.7 Permanent erosion control blanket is considered a variable quantity item. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit price. When requesting partial payment for the work, the CONTRACTOR shall be paid for the actual quantity of permanent erosion control blanket installed in accordance with the plans and specifications and made ready for service during the construction period.

16. STABILIZATION FABRIC

16.1 Stabilization fabric shall include furnishing and installing the woven fabric in riprap ditches and at other locations as directed by the PROJECT MONITOR. The stabilization fabric to be used is specified in Article 8 of the Technical Specifications.

16.2 Stabilization fabric used for underlining riprap ditches shall extend to the outside edges of the riprap to assure complete coverage. The edge of the stabilization fabric shall be held in place with metal pins until the riprap material has been placed over the entire area of fabric. Installation of stabilization fabric shall require approval of the PROJECT MONITOR before backfilling with riprap material. Stabilization fabric will be required in all ditches when the slope is greater than negative five percent (-5%).

16.3 The fabric shall be lapped a minimum of one foot. The upstream layer of fabric shall be placed over the downstream layer of fabric. The lapped fabric shall be secured to the bottom of the ditch with pins placed on a one foot spacing.

16.4 Stabilization fabric shall include furnishing and installing the woven fabric as shown on the plan details and at other locations as directed by the PROJECT MONITOR.

16.5 Stabilization fabric is considered a variable quantity item. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit price. When requesting partial payment for the work, the CONTRACTOR shall be paid for the actual square yards of stabilization fabric installed in accordance with the plans and specifications and made ready for service during the construction period.

17. NON-WOVEN FILTER FABRIC

17.1 Non-woven filter fabric shall include furnishing and installing the woven fabric in riprap checkdams, riprap ditches, riprap pads and at other locations as directed by the PROJECT MONITOR. The non-woven filter fabric to be used is specified in Article 8 of the Technical Specifications.

17.2 Non-woven filter fabric used for underlining riprap ditches whose slopes are less than five percent. The filter fabric shall extend to the outside edges of the riprap to assure complete coverage. The edge of the non-woven filter fabric shall be held in place with metal pins until the riprap material has been placed over the entire area of fabric. Installation of non-woven filter fabric shall require approval of the PROJECT MONITOR before backfilling with riprap material.

17.3 Non-woven filter fabric used for underlining riprap checkdams shall cover the upstream face. The fabric shall be buried one foot below the bottom of the ditch and extend four feet under the dam. The fabric shall be covered with one foot of riprap on the upstream face as show in the plans.

17.4 The fabric shall be lapped a minimum of one foot. The upstream layer of fabric shall be placed over the downstream layer of fabric. The lapped fabric shall be secured to the bottom of the ditch with pins placed on a one foot spacing.

17.5 Non-woven filter fabric shall be used to encase crushed limestone and perforated pipe used as a French drain to dewater areas from heavy underground water seepage.

17.6 Non-woven filter fabric is considered a variable quantity item. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit price. When requesting partial payment for the work, the CONTRACTOR shall be paid for the actual square yards of non-woven filter fabric installed in accordance with the plans and specifications and made ready for service during the construction period.

18. FRENCH DRAIN

18.1 French Drain shall consist of furnishing and installing ALDOT No. 1 limestone, non-woven filter fabric and six inch perforated and solid plastic pipes and pipe fittings as specified in Article 13 of the Technical Specifications. Installation of the French drain shall include all required excavation, laying of fabric, stone and perforated and solid plastic pipes and fittings and backfilling over the top of the trench. French drain is not shown as a line item in the Principal Items of Work. The costs associated with this article should be included in the ALDOT No. 1 limestone, non-woven filter fabric and each type of the six inch plastic pipes.

18.2 The trench shall be excavated and cleaned of all loose material to provide a smooth surface for the placement of filter fabric. The filter fabric shall be placed (as shown in the plan details) in the trench and fitted along the sides and bottom before placing stone. An eighteen (18) inch wide by four inch thick layer of stone shall be placed over the fabric; then the pipe shall be laid making certain that the three-quarter (3/4) inch diameter holes or slots face downward. The stone shall be placed over the pipe to the required depth, and the filter fabric lapped a minimum of one foot over the stone according to the plan details, so that no stone is exposed. The drain shall be covered with care so that the structure will not be disturbed.

18.3 Six inch French drain shall be used at the approximate locations that are affected by underground springs or natural seepage from the highwall which might adversely affect the finished slope stability. Installation of the six inch French drain will require identifying the wet areas and intercepting the underground springs or water seepage with six inch perforated pipe, which, in turn, will drain into the side of the finished ditch at the toe of the finished slope. The six inch solid pipe will be used to convey the water to the riprap outfall of the French drain.

18.4 French drain is not considered a variable quantity item. The CONTRACTOR shall be paid for the actual quantities of the stone, non-woven filter fabric and six inch corrugated plastic pipes that are installed and made ready for service. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit prices of the stone, filter fabric and six inch pipes. When requesting payment for the work, the CONTRACTOR shall be paid for the quantities installed when constructing the French drain.

19. CONSTRUCTION SIGNS AND SAFETY DEVICES

19.1 Construction signs and safety devices includes furnishing the signs, labor and materials to assemble and erect signs of the designated types at the locations designated by the PROJECT ENGINEER, referred to in these Special Provisions and specified in Article 9 of the Technical Specifications.

19.2 Construction signs shall conform to the standards of the Manual on Uniform Traffic Control Devices, 2009 Edition, published by the U.S. Department of Transportation, Federal Highway Administration. The construction signs used on the project shall be in good condition with legible lettering and exhibit good reflective qualities. Signs with taped-over or marked-out words will not be acceptable.

19.3 The CONTRACTOR shall furnish and erect construction signs for this project and shall leave them in place throughout the construction period. Upon completion and final approval of the project, the CONTRACTOR will remove all construction signs.

19.4 Construction signs shall be maintained during the construction period and replaced by the CONTRACTOR if they become damaged or if they are removed from their original locations.

19.5 Construction signs shown in the plans are required for this project but are not shown as a separate item in the Principal Items of Work. The cost associated with the construction signs is to be included in the bid price for mobilization.

20. SILT FENCE

20.1 Silt fence consists of furnishing and installing Type A and Type B silt fences, complete with posts, and providing all necessary pins and excavation required to complete its installation as specified in Article 12 of the Technical Specifications. Each Type of silt fence shall be installed at locations shown on the plans and as directed by the PROJECT MONITOR.

20.2 Type A and Type B silt fences shall be unrolled and the filter fabric stretched to the manufacturer's recommended post spacing. Type A silt fence may be built in place as per the details shown on the plans. Type B silt fence may be installed from a pre-fabricated kit. The fabric shall be oriented on the upstream side of the post and each post shall be driven into the ground a minimum depth of fifteen (15) inches. The lower six inches shall be pinned to the side of the six inch by six inch trench excavated directly under the fabric of the fence. The trench shall be backfilled with material free of stones and debris, and compacted. In areas where high water concentrations are likely to

develop, the CONTRACTOR shall reinforce the silt fence with staked haybales as shown on the silt fence details in the plans. In area with irregular contours, the area directly under the Type B silt fence shall be smoothed to provide uniform contact of the silt fence and fabric with the underlying surface. Areas excavated for the fence shall be compacted to the satisfaction of the PROJECT MONITOR.

20.3 Successive rolls of Type B silt fence shall be spliced together by driving the first stake of the second roll directly behind the last stake of the first roll of temporary silt fence. The filter fabric of the second roll of silt fence shall pass between the two posts driven back-to-back. The two posts shall be bound at the top and center of the post with two loops of No. 9 gauge wire. The ends of the wire shall be twisted together with three turns of the wire.

20.4 The method of measurement of silt fence shall be as follows: Type A silt fence shall be measured along the top of the fencing as installed, and Type B silt fence shall be measured as per the manufacturer's length per roll of fencing installed plus any fraction of a roll installed as measured along the top edge of the fabric.

20.5 Type A and Type B silt fences are considered a variable quantity item. It shall be the CONTRACTOR's responsibility to include all items associated with this article in the unit prices. When requesting partial payment for work performed, the CONTRACTOR shall be paid for the actual quantity installed on the project as shown on the plans or as directed by the PROJECT MONITOR during the construction period.

21. GROUND PREPARATION

21.1 Ground preparation shall consist of minor grading and smoothing to uniform contours, furnishing and spreading the fertilizer and lime in separate operations and incorporating them into the upper three inches of soil by mechanical means. Ground preparation shall begin immediately upon completion of final grading. All sheet erosion, rills, gullies and washes shall be smooth-graded, seeded and mulched before the final inspection.

21.2 Before ground preparation begins, the graded areas must be approved by the PROJECT MONITOR for smoothness, slope and grade and shall be free of all boulders, rocks, sticks, roots and other debris that would impede vegetation. The CONTRACTOR shall notify the PROJECT MONITOR approximately twenty-four (24) hours before ground preparation begins. The PROJECT MONITOR shall be present during the entire ground preparation operation and approve the type of equipment used to incorporate the lime and fertilizer into the ground. Compacted surface areas, roadways and storage areas may require scarifying with chisel plows or other suitable equipment as directed by the PROJECT MONITOR.

21.3 All areas to receive ground preparation shall be tested by the DEPARTMENT prior to applying lime. If the soil tested indicates a need for a greater quantity of soil amendments than specified in these Special Provisions, the CONTRACTOR shall apply the quantity of amendments recommended by the soil test.

21.4 The CONTRACTOR shall apply a minimum quantity of six tons of dolomitic lime per acre distributed evenly to all areas of the project. Commercial fertilizer shall be applied at a rate of seven hundred fifty (750) pounds per acre to all disturbed areas of the project. The commercial fertilizer shown in

the Principal Items of Work is based on grade 13-13-13 fertilizer. The CONTRACTOR will have the option of using a grade 13-13-13 or a sufficient quantity of any other acceptable grade or grades of commercial fertilizer that will provide the required coverage.

21.5 Areas disturbed by construction at the site shall be shaped to smooth contours to blend with the surrounding terrain. The PROJECT MONITOR shall determine the areas on which ground preparation shall begin. Fertilizer and lime shall be spread in separate operations over the work areas and immediately incorporated into the upper three inches of soil by mechanical means, in order to form a seedbed. Lime shall not be distributed on the project site during windy conditions. The mechanical incorporation shall be conducted parallel to the contour of the finished slope. The application of fertilizer and dolomitic lime shall be completed and incorporated into the soil before applying the designated seeding mixture. The ground preparation operation shall begin before work on other areas is begun. The seeding operation shall begin immediately upon completion of the ground preparation operation. In the event that the seeding operation is delayed longer than twenty-four (24) hours, the seedbed shall be prepared again as stated above.

21.6 Original vendor's tickets, from a certified scale, showing the producer, item and gross, tare and net weights of the materials used on the project shall be submitted to the PROJECT MONITOR before the lime and fertilizer are spread. These tickets shall be required for payment of those items covered in this article.

21.7 Dolomitic lime and commercial fertilizer (13-13-13) are considered variable quantity items. The CONTRACTOR shall be paid for the actual quantity of dolomitic lime and commercial fertilizer used on the project as specified by

these Special Provisions and as directed by the PROJECT MONITOR. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit prices. When requesting partial payment for the work, the CONTRACTOR shall be paid for the approved quantities of dolomitic lime and commercial fertilizer that have been applied to a designated area and incorporated into the ground during the construction period.

22. SEEDING

22.1 Seeding shall consist of furnishing and spreading the seed mixture and compacting the seedbed.

22.2 A seed mixture containing a minimum of two nitrogen-fixing species and two perennial (permanent) species shall be mechanically spread by the CONTRACTOR over the project site. The seed mixture approved for this project is listed in Article 1.3 of the Technical Specifications.

22.3 The seeding operation shall be separate from ground preparation operations and shall begin immediately upon completion of ground preparation. Once prepared, the seedbed must be seeded within twenty-four (24) hours. Seeding operations shall begin on areas where ground preparation has been completed, as directed by the PROJECT MONITOR. The PROJECT MONITOR shall be present during the entire seeding and compacting operations. The CONTRACTOR shall notify the PROJECT MONITOR approximately twenty-four (24) hours before the seeding operation begins.

22.4 If the seeding operation is either delayed longer than twenty-four (24) hours following ground preparation, or if weather (rain) has adversely affected ground conditions prior to seeding as determined by the PROJECT MONITOR, the seedbed shall be prepared again, according to Article 21.5 of these Special Provisions, without additional compensation.

22.5 The seedbed shall be compacted with a cultipacker after the seeds are planted. Compacting of the seedbed shall be accomplished on each area of the site after each area is completely seeded.

22.6 Ground preparation, seeding and mulching operations shall be performed on the project at the time determined by the PROJECT ENGINEER and PROJECT MONITOR. If normal temperatures and rainfall conditions are acceptable, the CONTRACTOR will be allowed to perform revegetation operations during the summer and winter months, even when normal revegetation operations are usually suspended. The CONTRACTOR shall allow enough time to complete the seeding operations within the number of work days specified in the contract. The CONTRACTOR will not be granted any additional time to perform seeding operations. The time needed to complete the seeding operations has been included in the number of work days specified by the contract.

22.7 Once the PROJECT MONITOR has given approval for the CONTRACTOR to begin the seeding operations, the CONTRACTOR shall finish grading or regrade (as needed) any remaining areas on the project, repair any damage that occurred during the delay period and perform ground preparation (including liming and fertilizing) according to Article 21 of these Special Provisions. The appropriate seasonal mixture of ground cover species shall be planted at this time according to the species and rates shown in Section 1.3 of the Technical Specifications. Mulching shall be performed as outlined in Article 23 of these Special Provisions. All remaining items of work shall be completed at this time.

22.8 Seeding is considered a variable quantity item. It shall be the CONTRACTOR's responsibility to include all items associated with this article in his unit price. When requesting partial payment for the work, the

CONTRACTOR shall be paid for the acres of seeding completed and compacted during the construction period.

23. MULCHING

23.1 Mulching shall consist of furnishing, applying mulching material, and crimping the mulch material over the seeded areas at a rate of two tons per acre in accordance with Article 2 of the Technical Specifications.

23.2 The mulching and crimping operations shall be conducted simultaneously. Mulched areas left uncrimped that lose the mulching material, due to weather action or other causes, shall be mulched and crimped again without any additional compensation.

23.3 Mulch shall be applied mechanically to all seeded areas of the project with the exception of those areas hydroseeded or covered with erosion control protection blanket. No mulch shall be placed under or over slope protection or erosion control blanket. The mulching machine shall use rectangular or round bales of hay or cereal straw only.

23.4 Mulch shall be applied mechanically to all slopes (conventionally seeded) and crimped into the seedbed with a crimper having sufficient weight to crimp the mulch to a depth of two inches. The square-edged blades of the crimper shall be spaced along the axle not less than six inches but not more than eight inches on centers measured parallel with the axle. Disc harrows shall not be used to perform the crimping operation. Thick hay build up in spots commonly referred to as "duck nests" caused by an uneven application of mulch shall be corrected by use of hand tools or hand labor in order to minimize disturbance to recently planted areas prior to performing crimping operations.

23.5 Mulching material left on the project for any length of time before use shall be stored in well-drained locations, on wooden pallets and shall be protected from the weather by covering with tarpaulin or six mil plastic sheeting. The covering should be secured to prevent it from being blown off by the wind.

23.6 Mulching is considered a variable quantity item. It is the CONTRACTOR's responsibility to include all items associated with this article in his unit price. When requesting partial payment for the work, the CONTRACTOR shall be paid for the tons of mulching material applied and crimped during the construction period.

24. TERRACES

24.1 Terraces shall be built in the furnished slopes of the highwall backfill and/or Finished cut slopes within the project limits as determined by the PROJECT ENGINEER. The CONTRACTOR shall furnish all equipment and personnel required to complete the excavating, grading and shaping of the terraces. Erosion control blanket shall be installed in the flowline of each terrace as discussed in Article 13 of the special provisions.

24.2 The CONTRACTOR will be required to build the terraces in the locations that are shown on the plans or designated in the field by the PROJECT ENGINEER and/or PROJECT MONITOR. The PROJECT MONITOR will lay out the terraces and the CONTRACTOR will be required to build the terraces on the alignment and slope established by the PROJECT MONITOR.

24.3 Terraces are considered a variable quantity item. It shall be the CONTRACTOR' responsibility to include all items associated with this article in his unit price. The CONTRACTOR will be paid for the total linear feet of

terraces built on the project site. When requesting partial payment for the work, the CONTRACTOR shall be paid for the estimated quantity of terraces constructed during the construction period.

25. ENVIRONMENTAL PROTECTION

25.1 The Clean Water Act, as amended, Title 40, Code of Federal Regulations, Part 122, 123 and 124, dated November 16, 1990, shall apply to this project. An Alabama Department of Environmental Management (ADEM) storm water discharge permit has been secured by the DEPARTMENT. The CONTRACTOR shall keep a copy of the NPDES General Permit for stormwater run-off in his possession at all times while on the construction site. All regulations and provisions of the permit shall be an integral part of these Special Provisions. An ADEM stormwater run-off permit identification sign shall be furnished and installed by the CONTRACTOR as part of the regulations and provision of this permit. Any fines for violations assessed against the DEPARTMENT by ADEM as a result of the CONTRACTOR's negligence or failure to fulfill the provisions of the ADEM permit shall be the responsibility of the CONTRACTOR. Monies for the fine(s) shall be deducted from the CONTRACTOR's final payment.

25.2 The CONTRACTOR shall employ the materials in the Principal Items of Work necessary, as directed by the PROJECT MONITOR, to abate polluted storm water discharge from the project and successfully fulfill all of the ADEM permit requirements.

25.3 Fuel tanks, whether fixed-mounted or tanker trailers, shall be enclosed by an earthen berm built prior to project construction at a location outside the main grading area but within the project limits as directed by the PROJECT MONITOR. The fuel tank(s) shall be located away from streams, and natural

drainage areas. The berm shall be a minimum of two feet high and two feet wide at the crest. The side slopes of the berm shall have a minimum of two horizontal to one vertical slope. The inside toe to toe dimension of the enclosure shall be a minimum of sixteen (16) feet by sixteen (16) feet. The berm shall be constructed of spoil material with the interior of the containment plated with a layer of impervious clay material (or best material available) a minimum of one foot thick. Additional thickness may be required if suitable material is not available. Material used to construct the berm shall be free of large, sharp rocks. A six inch diameter polyvinyl chloride (PVC) pipe shall be installed through the berm with the inlet of the pipe level with the bottom of the enclosure. The pipe shall be equipped with a six inch diameter gate valve, which shall be closed at all times.

25.4 In lieu of plating the side slopes and bottom of the containment area with impervious clay material, a polyethylene (PE) liner may be installed. The liner shall cover the bottom and sides of the containment and extend one foot onto the top of the berm. The edges of the liner shall be secured by steel pins placed two feet on centers. All seams between polyethylene sheets shall be heat welded to form continuous bonds. The PE liner to be used is specified in Article 10 of the Technical Specifications.

25.5 Upon completion of the project, the fuel containment berm and the adjacent area shall be graded to blend with the surrounding terrain. Before reclaiming this area, any contaminated soil and/or the PE liner shall be removed and disposed of at an approved disposal facility.

25.6 The CONTRACTOR shall mount and maintain a durable non-freezable rain gauge, with graduated markings of one tenth of an inch, and install an ADEM stormwater permit identification sign within the project construction limits in

an area unobstructed by anything that would shelter the gauge from direct rainfall. The rain gauge and sign shall be easily accessed by the PROJECT MONITOR and CONTRACTOR's personnel. The rain gauge and sign shall be securely mounted on 4 inch by 4 inch by 8 foot treated posts. The sign shall be installed at a designated location on treated posts set a minimum of eighteen (18) inches in the ground. The sign shall be reinforced with a half inch thick treated plywood with the same outside dimensions as the signs. The CONTRACTOR shall furnish and install an ADEM stormwater identification sign according to the sign detail shown in the Drawing Section of these contract specifications. The cost associated with furnishing and installing the rain gauge and stormwater run-off permit identification sign shall be included in the CONTRACTOR's bid price for Mobilization.

25.7 Normal equipment maintenance may be performed on the project. However, all maintenance residue such as, but not limited to, engine oil, engine fluids, hydraulic fluids, oil filters, air filters, grease products, and other related items shall be collected in approved containers. The products shall then be disposed of offsite at an approved disposal facility or recycling center.

25.8 All fuel and oil spills shall be cleaned up immediately to minimize ground contamination. The CONTRACTOR shall remove and store the contaminated material in approved containers until treatment can be performed. For minor fuel and oil spills or leaks, the contaminated material shall be spread uniformly over black six mil polyethylene material and exposed to the sun for four to five days, which will allow time for the fuel and oil to volatilize. The material shall be stirred and turned over each day and not allowed to be rained on during the drying process. If there is a chance of rain, the material shall be covered with an additional

piece of black polyethylene. Once this process has been completed, the material contaminated from fuel may be disposed of by spreading the material over the entire site. However, the material contaminated from oil shall be tested to determine the total petroleum hydrocarbon (TPH) content. A qualified laboratory shall be used to test the material. If the material does not meet the minimum requirements, more drying time will be required. Further testing and drying will be required until the material meets the minimum requirements. Then, the CONTRACTOR may spread the material contaminated from oil over the project site.

25.9 The CONTRACTOR, his employees, and subcontractors and their personnel shall follow and abide by the rules for good housekeeping. The project site shall be kept clean of all personal garbage and trash (i.e. drink cans, bottles, lunch sacks, plastic wrappers, fast food container, etc.). The CONTRACTOR shall provide onsite containers for employees to place all garbage and trash each day. The trash and garbage shall be removed from the site and/or disposed of properly as directed by the PROJECT MONITOR.

25.10 Environmental protection on this project has not been listed as a line item on the Principal Items of Work. Thus, it is the responsibility of the CONTRACTOR to cover the cost of these items of work in the bid prices of other items of work.

26. MOBILIZATION

26.1 Payment for mobilization is compensation for construction signs, ADEM stormwater permit identification sign, safety devices, clearing for access roads, and assembling equipment, supplies, materials and labor forces at the project. No additional payment will be made for the removal of equipment, supplies,

materials, construction signs and safety devices from the project. The CONTRACTOR's mobilization bid price shall not exceed fifteen percent (15%) of the Total Contract Bid Price.

26.2 Mobilization for this project will be paid as follows:

50% Mobilization bid price paid when project is 10% complete.

Balance of Mobilization bid price paid when project is 50% complete.

The accumulated total amount paid for Mobilization shall not exceed the CONTRACTOR's lump sum bid for Mobilization.

26.3 Mobilization payments may be requested according to Article 27 of these Special Provisions only during regular construction period payment requests.

27. PAYMENT

27.1 Payment for work on this contract will be made on a combination lump sum/variable quantity basis, based on estimated quantities shown or actual quantities used on this project. Unit prices are required on all Principal Items of Work. It is the CONTRACTOR's responsibility to ensure that he has covered all items of work shown in the plans and the contract specifications when submitting unit prices. The CONTRACTOR's unit prices will be used in conjunction with the DEPARTMENT's given estimate of quantities to calculate a Total Contract Bid Price. Failure of the CONTRACTOR to submit unit prices for all items of work will result in the bid being automatically rejected without further consideration.

27.2 The DEPARTMENT's given estimates for lump sum and variable quantity items are only estimates and are explicitly not guaranteed by the DEPARTMENT. If field conditions have altered the scope of work the variable quantities may be increased or decreased at the discretion of the DEPARTMENT. Additional lump sum quantities will not be compensated without prior written approval of the DEPARTMENT. Payment for lump sum items will be based on quantities listed in the Principal Items of Work. The estimated quantities are provided only as a standard guide by which all CONTRACTORS are to bid, in order that a uniform and consistent Total Contract Bid Price can be established for each bid proposal. This will enable the DEPARTMENT to equally compare all bid proposals.

27.3 Each line item on the Bid Proposal Form shall be bid on lump sum or a variable quantity basis according to the DEPARTMENT's estimated quantity. Each extended price will be calculated by multiplying the CONTRACTOR's unit price by the DEPARTMENT's estimated quantity. The extended prices will be totaled to obtain a Total Contract Bid Price. The contract will be awarded based on the Total Contract Bid Price.

27.4 If there is any error in calculating the extended price of a bid item, the unit price submitted by the CONTRACTOR will prevail and the extended price will be re-calculated. Likewise, if there is an error in adding the extended prices to arrive at a Total Contract Bid Price, the Total Contract Bid Price will be re-calculated and the resulting price will prevail.

27.5 If the total amount encumbered by the contract reaches or exceeds the Total Contract Bid Price, the DEPARTMENT may, at its discretion, delete any or all remaining portions of the Principal Items of Work in the contract and thus terminate the contract.

27.6 Payment for work accomplished during each construction period will be based on the DEPARTMENT's review of the CONTRACTOR's estimate of actual work performed and completed during that construction period. Payment for the work accomplished at the site during each construction period will be made only when that item is completed and made ready for service. No payment shall be made for material stored on the project site.

27.7 It is the CONTRACTOR's responsibility to verify all quantities before submitting his unit prices. The CONTRACTOR shall be paid in accordance with Articles 1-3 of the Supplementary Conditions.

TECHNICAL SPECIFICATIONS

TECHNICAL SPECIFICATIONS INDEX

TECHNICAL SPECIFICATIONS

1. REVEGETATION MATERIALS

1.1 The seed mixtures approved for use on this project are listed in Article 1.3 of these Technical Specifications.

1.2 For all seeding operations on this project, each bag of seed used shall have the required Alabama seed certification tag securely affixed. Any bags of seed provided by the CONTRACTOR which do not have the seed tags affixed to the bag will be rejected by the PROJECT MONITOR. All bags of seed shall be opened only in the presence of the PROJECT MONITOR; he alone is authorized to remove the seed certification tag from each bag. Each seed certification tag shall include a listing of each species, percent germination, percent purity, and testing date. Germination shall be at least eighty-five percent (85%) and purity shall be at least ninety-five percent (95%), unless otherwise noted. The seed shall be purchased from only an Alabama licensed dealer and shall have been tested no more than six (6) months prior to planting. If the seed has not been tested within six (6) months, it shall be retested at Auburn University at the CONTRACTOR's expense, and these results shall be presented to the PROJECT MONITOR prior to commencement of seeding operations. The seed shall be premixed with the species specified in Article 1.3. The seed of the nitrogen-fixing species shall be inoculated with the appropriate commercial culture according to the manufacturer's instruction before mixing. The inoculated seed shall be allowed to dry to a free-flowing state before being mixed with the other seeds. Inoculated seeds shall be protected from exposure to the sun and/or contact with commercial fertilizer. All of the procedures outlined above shall be required for payment of the seeding work.

1.3 SEEDING MIXTURES (SPECIES AND RATES)

Winter Wheat	40 lbs./acre
Annual Rye	15 lbs./acre
Little Bluestem	4 lbs./acre
Big Bluestem	4 lbs./acre
Switchgrass	5 lbs./acre
Partridge Peas	7 lbs./acre
Redland MAX Clover	20 lbs./acre
Durana Clover	15 lbs./acre
TOTAL	110 lbs./acre

1.4 TEMPORARYSEEDING MIXTURES (SPECIES AND RATES)*

Winter Wheat	20 lbs./acre
Annual Rye Grass	15 lbs./acre
TOTAL	35 lbs./acre

* These rates are required for the seed only and exclude any weight attributed to inoculated or protective coatings. Seed amount(s) shall be increased to compensate for the weight of the coating.

2. MULCHING MATERIAL

2.1 Mulching material shall be exclusively grass hay or cereal straw, which is sound and fit for animal consumption. The hay or straw shall be free from weeds, bushes or other noxious material. Crop stubble or other coarse material shall not be acceptable as mulching material. A minimum of two tons of rectangular or round bales shall be applied per acre as documented and directed by the PROJECT MONITOR. Temporary mulching shall be applied at a rate of one ton per acre.

2.2 Tickets from a certified vendor's scale, showing the number of haybales, size and gross, tare and net weights of the haybales for each load shall be submitted to the PROJECT MONITOR at the time the mulching material is delivered to the project. These tickets shall be submitted daily and collected by the PROJECT MONITOR, and shall be required prior to payment of Mulching.

2.3 The CONTRACTOR shall make all necessary agreements to weigh the haybales at a certified scale before delivery is made to the project site.

3. STAKED HAYBALES

3.1 Haybales used for staking shall be exclusively grass hay or cereal straw. The baled material shall be sound and fit for animal consumption. The bales shall be tied securely with two strands of plastic twine. Each haybale shall be a minimum of thirty (30) inches long.

3.2 Haybales shall be secured with two stakes, each measuring two inches wide, thirty-six (36) inches long and one inch thick. Each stake shall be cut from commercial grade lumber stock and have one end pointed.

4. SEDIMENT CONTROL LOGS

4.1 Sediment control logs shall be twelve (12) inches in diameter and ten feet long as manufactured by American Excelsior Company. They shall be manufactured from Aspen Excelsior Fibers and bound with a durable tubular polyester netting with metal clips or knotted ends. The logs may be cut to the length desired in the field by first binding the segments with nylon ties to close the ends before cutting the logs.

5. EROSION CONTROL BLANKET

5.1 Erosion control blanket used on this project shall be North American Green, SC-150 or equivalent. Prior approval by the PROJECT ENGINEER is required before any material can be substituted.

5.2 Erosion control blanket shall be manufactured from a mat of wheat or oat stubble at a rate of 0.35 pounds per square yard and coconut fibers at a rate of 0.15 pounds per square yard. The stubble and fibers shall be distributed evenly over the blanket area to produce a mat of uniform thickness. The top and bottom of the mat shall be covered with photodegradable extruded plastic netting. The netting and mat shall be sewn together one and a half (1.5) inches on centers with cotton thread. The mesh opening for one net shall be 3/8 inch by 3/8 inch. The other net shall have a mesh size of 3/4 inch by 3/4 inch openings. The blanket shall have a minimum width of six and a half (6.5) feet and contain sixty (60) square yards per roll.

5.3 The six inch wooden stake used to install the erosion control blanket shall consist of hardwood oak manufactured into a tapered "1" shaped spike resistant to breakage. The hardwood stake shall have the following dimensions:

Crown: 1.25 inches
Body Width: .4 x .6 inches
Total Length: 6 inches

The CONTRACTOR may obtain the six inch wooden stakes from North American Green (1-800-772-2040) or an equivalent manufacturer.

6. SLOPE PROTECTION BLANKET

6.1 Slope protection blanket used on this project shall be North American Green, SC-150 or equivalent. Prior approval by the PROJECT ENGINEER is required before any material can be substituted.

6.2 Slope protection blanket shall be manufactured from a mat of wheat or oat Stubble at a rate of 0.35 pounds per square yard and coconut fibers at a rate of 0.15 pounds per square yard. The stubble and fibers shall be distributed evenly over the blanket area to produce a mat of uniform thickness. The top and bottom of the mat shall be covered with photodegradable extruded plastic netting. The netting and mat shall be sewn together one and a halt inches on centers with cotton thread. The mesh opening for one net shall be 3/8 inch by 3/8 inch. The other net shall have a mesh size of 3/4 inch by 3/4 inch openings. The blanket shall have a minimum width of six and a half feet and contain sixty (60) square yards per roll.

6.3 The six inch wooden stake used to install the slope protection blanket shall consist of hardwood oak manufactured into a tapered "1" shaped spike resistant to breakage. The hardwood stake shall have the following dimensions:

Crown: 1.25 inches
Body Width: .4 x .6 inches
Total Length: 6 inches

The CONTRACTOR may obtain the six inch wooden stakes from North American Green (1-800-772-2040) or an equivalent manufacturer.

7. PERMANENT EROSION CONTROL BLANKET

7.1 Permanent erosion control blanket used on this project shall be North American Green, C-350 or equivalent. Prior approval by the PROJECT ENGINEER is required before any material can be substituted.

7.2 Permanent erosion control blanket shall be manufactured from three reinforced mats of polypropylene grids and coconut fibers at a rate of 0.5 pounds per square yard. The coconut and fibers shall be distributed evenly over the blanket area to produce a mat of uniform thickness. The top mats consist of a grid of polypropylene weighing 8.5 pound per 1,000 square feet and the bottom mat consists of a grid weighing 8.5 pounds per 1,000 square and 20 pounds per 1,000 square feet. The polypropylene grid shall be treated with adequate concentrations of carbon black to provide for ultraviolet protection. The coconut mat shall be sewn together one and a half inch by two inch spacing using cotton thread. The mesh opening for each polypropylene and grid mat shall be ½ inch by ½ inch. The blanket shall have a minimum width of six and a half feet and contain fifty five (55) square yards per roll.

7.3 The six inch wooden stake used to install the slope protection blanket shall consist of hardwood oak manufactured into a tapered "1" shaped spike resistant to breakage. The hardwood stake shall have the following dimensions:

Crown: 1.25 inches
Body Width: .4 x .6 inches
Total Length: 6 inches

The CONTRACTOR may obtain the six inch wooden stakes from North American Green (1-800-772-2040) or an equivalent manufacturer.

8. STABILIZATION FABRIC

8.1 Stabilization fabric used on the project shall be Mirafi 600X or equal. The ground stabilization fabric shall have a design specification equaling or exceeding the minimum requirements described below.

8.2 The fabric shall have a grab strength of 300 pounds, a burst strength of 600 pounds and a trapezoidal tear strength of 120 pounds. The fabric shall contain carbon compounds to protect it from ultraviolet radiation.

8.3 Metal pins shall be used to anchor the stabilization fabric. Metal pins shall be made of 3/16 inch diameter wire with a corrugated design. The pins shall be a minimum of twelve (12) inches long and shall be corrugated to resist uplift pressure. The corrugation shall be in a zigzag pattern for a minimum of twelve (12) inches along the length of the pin. The pin shall be equipped with one and a half inch flat washer and bradded head to effectively secure the fabric to the ground surface.

8.4 Any alteration from the specified stabilization fabric will require approval from the PROJECT ENGINEER before construction begins.

9. NON-WOVEN FILTER FABRIC

9.1 Non-Woven filter fabric for French drains shall be Mirafi 140N or equal. The fabric shall be a minimum of sixty (60) mils thick, have a grab strength of one hundred twenty (120) pounds and have a percolation rate of 205 gallons per minute per square foot of fabric.

9.2 The non-woven filter fabric shall be ultraviolet (UV) protected and stabilized using carbon compounds.

10. CONSTRUCTION SIGNS AND SAFETY DEVICES

10.1 Construction signs shall conform to the standards of the Manual on Uniform Traffic Control Devices, published by the U.S. Department of Transportation, Federal Highway Administration.

10.2 Construction signs shown in the construction sign detail shall be located along the roadway adjacent to the project site as shown on the construction plans.

11. POLYETHYLENE LINER

11.1 Polyethylene liner shall be PERMALON X-150 or equal. The liner shall be nine mils thick, weigh thirty and one half (30.5) pounds per thousand square feet, have a tensile strength of twenty-three (23) pound-feet and an elongation of five hundred fifty (550) percent. The liner shall be ultraviolet (UV) stabilized.

12. SILT FENCE

12.1 Silt fence requirements and specifications for Type A and Type B shall be according to the following articles.

12.2 Type A silt fence shall be made of steel post, wire fencing and geotextile fabric. Type A silt fence shall be pre-fabricated as manufactured by TNS Advanced Technologies or the components purchased as individual parts and assembled in-place at the site.

12.3 The post shall be steel "T" shaped post and the wire fencing shall be thirty-six (36) inches high. The geotextile material shall be a non-woven – 100% polypropylene that is highly resistant to ultraviolet light deterioration. The fabric shall be mold and mildew resistant and non-biodegrable. TNS R035 or equal shall be used for the silt fence material.

12.4 The installation shall be conducted to the details shown in the plans and according to the manufacturers instruction.

12.5 The woven filter fabric for Type B silt fence shall be Filter-X, Mirafi 100X or equivalent fabric. The fabric shall be a minimum of five (5) mils thick, have grab strength of one hundred (100) pounds, a percolation rate of forty (40) gallons per minute per square foot and be protected against ultraviolet radiation.

12.6 Wooden posts furnished with the Type B silt fence shall be pre-weathered hardwood measuring one (1) inch by two (2) inches by four (4) feet long. The maximum spacing of the wood posts shall be eight (8) feet on centers. The thirty-six (36) inch wide fabric shall be attached to the post with two wire staples.

12.7 Type B silt fence shall be completely fabricated in the shop and ready for field installation without any other preparation.

13. PIPE

13.1 Drainage pipe shall be of the sizes and materials shown in these specifications. The eighteen inch and twenty-four inch diameter pipes shall be Advanced Drainage Systems smooth-lined N-12 corrugated plastic pipe or an equivalent as approved by the PROJECT ENGINEER.

13.2 The PE pipe shall be smooth-lined Advanced Drainage Systems, Inc., corrugated polyethylene (PE) tubing and coupling or equivalent. The eighteen (18) inch diameter pipe shall have a pitch of 2.70 and have 4.5 spiral corrugations per linear foot. The twenty-four (24) inch diameter pipe shall

have a pitch of 2.93 inches and have 4.1 spiral corrugations per linear foot. The pipe and couplings shall have adequate concentrations of carbon black to provide for ultraviolet protection.

13.3 Six inch diameter perforated corrugated polyethylene pipe and fittings shall be Advanced Design Systems (ADS) or equal. Tubing and fittings shall conform to ASTM D883 and ASTM 412. The corrugated tubing shall have three perforated holes measuring three quarters (3/4) inch diameter per row spaced at a maximum of four inches or slotted openings located between the corrugations and around the perimeter of the pipe in an alternating sequence along the length of the tubing.

13.4 Six inch diameter corrugated polyethylene solid pipe and fittings shall be Advanced Design Systems (ADS) or equal. Tubing and fittings shall conform to ADTM D883 and ASTM 412. The corrugated tubing shall have no perforated holes (3/4) or slotted opening in the perimeter of the pipe.

SEQUENCE OF CONSTRUCTION

SEQUENCE OF CONSTRUCTION
(In Order of Completion)

1. Install construction signs before any reclamation work begins at the site.

2. Place all temporary erosion control devices before any grading starts.

3. Install durable non-freezable rain gauge at the proper location to record rainfall and install ADEM Stormwater permit identification sign.

4. Construct an earthen berm for the fuel tank(s) if fuel is stored on the project site.

5. Notify AML Engineering personnel to locate property corners and markers.

6. Obtain a burn permit from the Bibb County Office of the Alabama Forestry Commission.

7. Begin clearing project site of vegetation, dispose of clearing debris and protect all property corners and markers. Remove any residual or household debris found on the site by hauling to an approved landfill.

8. Install all sediment control structures and riprap checkdams prior to dewatering the impoundments, (if water is present).

9. Begin grading spoil material to backfill impoundment and dangerous highwall to the design contours as shown on the plans.

10. Install temporary earthen berms at base of highwall, as needed, during grading operations.

11. Complete grading and placement of spoil material in the highwall and impoundment and compact all finished slopes.

12. Construction drainage ditches and install erosion control devices such as riprap checkdams, riprap lined ditches, terraces, erosion control blanket, slope protection blanket, permanent erosion control blanket and staked haybales.

13. Perform revegetation operations.

14. Clean-up site and remove construction signs.

Mr. Brian J. Wittwer, Acting Director
Mining and Reclamation Division
Alabama Department of Labor
Inspections Division
649 Monroe Street
Montgomery, Alabama 36131-5200

Dear Mr. Wittwer:

The Office of Surface Mining Reclamation and Enforcement (OSM) has reviewed the environmental assessment for the Piper II Abandoned Mine Land Project and determined that it adequately discusses the environmental issues and impacts associated with the project. Based on analysis of this document, we have determined that reclamation of this abandoned mine site would not have significant effects on the quality of the human environment and therefore conclude that no environmental impact Statement is necessary. Accordingly, pursuant to Section 4-160-50D.3 of the Federal Assistance Manual, you are authorized to proceed with this project.

OSM's authorization to proceed for the Piper II Abandoned Mine Land Reclamation Project will expire on 1/24/2015. Construction must begin on the project site prior to that date.

If you have any questions, please contact my staff at (205) 290-7282.

Sincerely,

Sherry Wilson
Field Office Director

Enclosures

SMCRA 35 YEARS

Gray and Indiana bats may use the Cahaba River for foraging or as a travel corridor, but no caves are located within the refuge. Indiana bats are known to use trees with loose or flaking bark as roost trees during the summer. No trees with loose bark are noted within the project area and none should be impacted during this project.

Please note that on August 9, 2007, the bald eagle was officially removed from the Federal list of threatened and endangered species. After the official delisting, the permitting of incidental take under the Endangered Species Act is no longer necessary. However, the bald eagle is still protected under the Migratory Bird Treaty Act and the Bald and Golden Eagle Protection Act (Eagle A ct). Accordingly, all recommendations from the *National Bald Eagle Management Guidelines* should be applied when implementing the proposed project if eagles are discovered in the project area. The guidelines explain when the protective provisions of the Eagle Act are applicable and provide information and recommendations on how to avoid adversely affecting bald eagles, especially during the nesting season. A copy of the document may be downloaded from the Service's website at: http://www.fws.gov/migratorybirds/issues/BaldEagle/NationalBaldEagleManagementGuidelines.pdf. In addition, step-by-step guidance to help you determine if your project is likely to disturb nesting bald eagles (a potential violation of the Eagle Act).

Highwall Reclamation:

Drainage from the proposed project area will enter an abandoned and collapsed mine portal (Discharge Point "2"). However, for the purposed of this consultation the Project Leader (Mr. Steve Miller – Refuge Manager) assumed that the mine portal is unable to accommodate all of the flow from the watershed during certain storm events. The resulting connection to the Cahaba River necessitates the inclusion of the Cahaba River within the action area of the proposed project.

Direct impacts will occur to approximately 45 acres of Refuge habitats within the project area. Habitat value is limited within the loblolly pine plantation that will be impacted. Plans call for the removal of all vegetation from the spoil pile in the project area. The spoil pile would then be used to fill the area below the highwall up to a 4:1 or flatter slope.

Reclamation is expected to increase public safety through the elimination of the highwall that is up to 80 feet in height. Reclamation is also expected to reduce long-term environmental impacts associated with sediment and coal-related contaminants reaching the Cahaba River. There is, however, the potential for the short term increases in the transport of sediment and coal fines to the Cahaba River during the construction phase of the project should the best management practices (BMPs) fail and the rainfall volumes exceed the mine portal acceptance capacity.

To monitor and insure that the Refuge has correctly assessed impacts to aquatic systems resulting from highwall reclamation and to monitor proposed BMPs, the Project Leader will implement a Quality Assurance Plan that was developed for the Refuge by the Alabama Ecological Services Field Office. This plan outlines the proposed monitoring that will be required before, during and after highwall reclamation.

If any of the following occur, than there must be re-initiation on this action:

1. any incidental take occurs
2. new information reveals effects of the Service's action that may affect listed species or critical habitat in a manner or to an extent not considered in this letter;
3. the Service's action is later modified in a manner that causes an effect to the listed species or critical habitat not considered in this opinion; or
4. a new species is listed or critical habitat designated that may be affected by the action.

In instances where any incidental take occurs, the operations causing such take must cease until re-initiation. If re-initiation is required, contact the Alabama Ecological Services Field Office

The location of the proposed project area upstream from the current stormwater discharge portal (Discharge Point "2") provides an additional level of protection. This will allow the Refuge to determine if the BMPs are sufficient to prevent the release of coal related constituents and/or sediments from the project area, and support the Project Leader's determination that the proposed project "may affect, but is not likely to adversely affect" the down stream action area which includes the Cahaba River.

The proposed sampling protocol for this project will also provide an additional level of verification that the proposed action is "not likely to adversely affect" listed, proposed, or candidate species or designated or proposed critical habitat, and support the Refuge's determination that all the effects of the proposed highwall reclamation project will be insignificant and discountable.

Best Management Practice:

Best management practices must be incorporated into the project design and utilized to control erosion during all phases of the proposed projects to prevent impacts to federally listed aquatic threatened and endangered species in the Cahaba River. Erosion control structures/diversions must be inspected within 24 hours of any rain event and immediate corrective action taken if erosion or soil runoff is observed. Maintenance of vegetated buffers adjacent to any ditches or drainages is also an important measure to insure erosion control, as is immediate revegetation of disturbed areas. Any work that results in exposed earth should be executed during periods when rainfall is not predicted. For specific design information, the "Alabama Handbook for Erosion Control, Sediment Control and Stormwater Management on Construction Sites and Urban Areas" (2003) is available from the Alabama Soil and Water Conservation Committee, or the 2002 version can be found on-line at http://www.swcc.state.al.us/erosion_handbook.htm.

Wetland Advisory

Upon review of the National Wetland Inventory (NWI) maps, it was determined that creek and wetland areas are along your proposed project area. The U.S. Army Corps of Engineers (COE) recommends that a project managers contact them if any amount of fill material may be placed in waters of the U.S., including any wetland. This includes mechanical land clearing and temporary stream rerouting or diversion. This also includes temporary or permanent basins constructed in intermittent or perennial streams for erosion control or storm water management purposes. Since your project involves a discharge of fill material into water of the U.S., the project managers will be required to apply for a Department of the Army permit. For very small impacts, the project could possibly be authorized under one the COE's Nationwide Permits or Regional Permits (with verification by the COE). However, projects impacting more than 0.5 acres of wetlands or 300 feet of stream will likely require an Individual Department of the Army Permit. The COE will work with the Refuge to assess and minimize the impacts and determine possible mitigation requirements to compensate for wetland or other losses and protect water quality and fish and wildlife.

Re: Piper Highwall Reclamation Project, Cahaba National Wildlife Refuge, Bibb County, Alabama

Dear Ms. Brown:

The U.S. Fish and Wildlife Service (FWS), in partnership with the Alabama Department of Industrial Relations Abandoned Mines Land Program (ALMP), proposes to undertake the multi-phase Piper Highwall Reclamation Project on Cahaba National Wildlife Refuge in Bibb County (Fig. 1). The project has five major objectives:

- Protect the visiting public from hazards associated with the dangerous strip mine highwall and coal waste piles;
- Protect the Cahaba River, wetlands in the vicinity, and the river's associated rare and endangered biota from offsite sedimentation and any pollution occurring from mine spoil and underground mine refuse eroding into the river;
- Restoration of the hydrology of the stream leading to Discharge Point 1 [see Fig. 1];
- Planting of longleaf pines, native shrubs, grasses, and legumes to provide permanent vegetative cover and to stabilize approximately 45 acres impacted by the undertaking;
- Protect that portion of the former town of Piper located on the Refuge, as well as features associated with the early – mid-20th century coal mining operations.

This undertaking will have "no adverse effect" upon any of the Refuge's or the County's historic properties, including Piper, a coal town established by the Little Cahaba Coal Company in 1901, and early-mid 20th century mining infrastructure, such as the "tipple" and Number 3 Mine Opening. A Phase 1 archaeological reconnaissance is not warranted, but monitoring during operations within or near the site of Piper and the tipple is recommended. These determinations are explained below in more detail. To facilitate your office's review and comment, I have enclosed the relevant sections of the West Blocton East, AL 7.5-minute quadrangle, the Blocton, AL 15-minute quadrangle (1934), the Brookwood, AL 30-minute quadrangle (1899); a section

from Squire's 1890 map of the Cahaba Coal Fields and the Blocton Basin; the 1939, 1950, and 1954 aerial photographs of the project area and Piper; and recent photographs.

Impact Assessment

The FWS and the ALMP seek to restore the ecological and hydrological function in the approximately 520-acre watershed located on the Cahaba National Wildlife Refuge through the multi-phase Piper Highwall Reclamation Project. Tasks include:

- Removal of existing timber and vegetation from the coal waste or spoil piles that run parallel to the strip mine highwall. The timber, primarily loblolly pine, was planted following cessation of the strip mining operations in the 1950s.
- The highwall, which ranges from an estimated height of 80 feet at or near Highway 24 to five or six feet at the southernmost terminus near the Cabaha River, will be backfilled to a 4:1 or flatter slope using the on-site trailing or spoil materials. A series of terraces, riprap-lined ditches, checkdams, silt fences, and staked bales will be used to slow the velocity of run-off and prevent sediment from entering the Cahaba River during and after the completion of this part of the undertaking. The first phase involves approximately 1,200 linear feet of highwall south of and adjacent to Highway 24; the second phase will run to the old Piper Number 3 mine opening; and the final phase will from the opening to the Cahaba River (Figs. 2 & 3).
- Following each phase, the disturbed areas will be limed, fertilized, seeded and mulched to establish a permanent cover of native grasses and legumes. Longleaf pine and native shrubs will be planted a year later to facilitate long-term stabilization.
- The Piper Number 3 mine opening will be permanently closed during the second phase of the highwall reclamation work. The opening will be lined with geo-textile fabric followed by large rock. Soil will be placed over the rock to facilitate establishment of a permanent vegetative cover (Fig. 6).
- The gob pile, which is associated with the Piper Mines' tipple, will be covered with on-site spoil and subsequently re-vegetated (Fig. 4 & 13).
- Above –ground architectural features associated with the town of Piper and the former mining operation, such as the concrete coal storage bin, will be avoided during the work (Fig. 5).

The Natural Resources Conservation Service mapped the soils on this portion of the Refuge as Sipsey-Nauvoo-Townley complex, 6-15% slopes (SnD); Sipsey-Nauvoo-Sunlight complex, 15-35% slopes (SsF); Gorgas-Rock outcrop complex, 35-60% slopes (GrG); and Palmerdale and Brillant soils, 6-45% slopes (PBF) [Fig. 7]. The National Wetlands Inventory (NWI) identified two wetland areas. The first wetland is near the tippler and gob pile site and labeled as one of settling ponds on Fig. 8. NWI labeled it as PFO6F [palustrine forested deciduous semipermanently flooded]/PUBHh [palustrine unconsolidated bottom partially flooded, diked/impounded]. The second wetland is located east of and adjacent to the highwall. NWI labeled it as PUBHx [palustrine unconsolidated bottom permanently flooded, excavated]. This area coincides with the abandoned and collapsed mine portal shown as Discharge Point "2" on Fig. 1. Currently, flow from the larger 520-acre watershed enters the mine portal during all but extreme storm events. During these events, water flows southwest along the base of the highwall

for approximately 800 feet before discharging into the Cahaba River. Closing of the mine portal will restore the hydrology of the stream leading to Discharge Point 1.

A review of the Regional Site Files, which are based upon those maintained by the Office of Archaeological Research at Moundville, did not reveal any recorded historic properties within or near the undertaking's "area of potential effect". The potential for intact precolumbian archaeological sites is quite low primarily due to substantial ground disturbance associated with the early – mid 20th century coal mining operations and slope. Archival and documentary research, however, revealed that the former town of Piper was located within and adjacent to the project area. North of the project area and Highway 24 is the former town of Coleanor (Fig. 1 & 14). The towns, though separated by a deep ravine, were connected by a Southern Railway trestle and swinging bridge.

Coal was mined around the Piper area prior to and during the Civil War; the earliest underground mining occurring around 1856. The Civil War-era mines used slave labor from Mississippi. Forges at Brierfield and nearby used this coal in the iron making process (Adams 2001: 2-3).

Joseph Squire described geology of the Cahaba Coal Field in a monograph published by the Geological Survey of Alabama in 1890. The project area is located within the Blocton Basin, which is 18 miles in length and 5 ¼ miles in width (Fig. 9). The basin is situated south and southwest of Bessemer, southeast of Woodstock and Vance's, north of Centreville, west of Aldrich and Montevallo, and southwest of Gurnee. The town of Blocton is located in the middle of the basin. It is drained by the Cahaba River and its tributaries. Very few railroads or "good wagon roads" exist. The principal railway was constructed by the Cahaba Coal Mining Company in 1890 along the valley edge of Caffey's Creek. The railway serviced its Blocton mines and connected with the Alabama Great Southern Railroad and the Birmingham Mineral Railroad near Woodstock. Another railway, the Brierfield, Blocton, and Birmingham Company's line, enters the basin from the east and runs from Montevallo to Gurnee and Blocton. These lines provided the coal companies access to the Alabama Great Southern Railroad, the Birmingham Mineral System, the Louisville and Nashville Company's main line, and the East Tennessee, Virginia, and Georgia mainline. The principal wagon roads mentioned by Squire included the Woodstock and Blocton Road, the Blocton and Pratt's Ferry Road, the Blocton and Centreville Road, the Blocton and Gurnee Road, the Woodstock and Centreville Road, the Tuscaloosa and Pratt's Ferry Road, the Boothtown and Greenpond Road, the Blocton and Shades Creek Church Road, and the Scottsville and River Bend Road (Squire 1890: 111-113).

Piper, one of the larger coal mining towns or communities in the Cahaba Coal Fields, was established by the Little Cahaba Coal Company in 1901. Coleanor was founded by the Blocton-Cahaba Coal Company in 1900 (Fig. 1 & 12). The Little Cahaba Coal Company opened two mines – Piper No. 1 and Piper No. 2 - in 1901 and 1903; a third mine was opened in 1947. The surface mine, which created the highwall and associated trailings, was mined by Davis, Terrell and Killiam under Permit Number C117, which expired November 30, 1976. 1914 marked the year of greatest employment in the Piper Mines with 432 miners and related workers. These "pick" mines exploited the Thompson Vein, described in 1910 as being between 4 ½ to 5 feet in thickness, and had a daily capacity of 1100 tons of coal (Tables 1 and 2). Jason Wilcox was listed as the Superintendent for both mines in 1911; William Hayes as the foreman of Piper No. 1

Table 1. Seam of Coal, Thickness, Number and Kinds of Openings, Employees, Mode of Ventilation, Etc.

Mine	Seam & Thickness	Openings	Presence of Explosive Gas	Miners	Inside Day Men	Outside Day Men	Total Length	Mode of Ventilation	Kind of Explosive Used
Piper No. 1	Thompson Seam [4-5 feet]	Slope – 1 opening	Yes	110	50	25	185	Fan	Black Powder
Piper No. 2	Thompson Seam [4-5 feet]	Slope – 1 opening	Yes	135	65	35	235	Fan	Black Powder
Coleanor	Thompson Seam [4-5 feet]	Slope – 1 opening	Yes	165	45	15	225	Fan	Black Powder

Source: Nesbitt 1911.

Table 2. Production Days Worked, Price Per Ton for Mining, Railroad Connections, Etc.

Mine	Company	Pick or Machine	Lump	Slack	Run of Mine	Total	Price/Ton	Number of Days Worked	Railroad Connections
Piper No. 1	Little Cahaba Coal Company, Piper	Pick	35,995	8,922	52,369	97,286	52 ½	276 ¾	Louisville & Nash, Southern Railway
Piper No. 2	Little Cahaba Coal Company, Piper	Pick	49,925	10,828	74,182	134,935	52 ½	266	L&N, Southern Railway
Coleanor	Blocton Cahaba Coal Company, Coleanor	Pick	31,397	10,539	42,922	84,858	52 ½	278	L&N, Southern Railway

Source: Nesbitt 1911.

and J.W. Nash as the foreman of Piper No. 2. All three individuals resided in Piper (Cahaba Trace Commission 2000; Alabama Department of Industrial Relations 2011: Nesbitt 1911).

The Thompson or Underwood Seam was one of several workable coal seams present in the Blocton Basin. Squire (1890: 114) described it as a "solid bench of five and a half feet of good quality well suited to coking, steam or domestic purposes". A section of the seam is shown in Fig. 10.

At least four mining accidents occurred in the three underground mines. On February 27, 1906, a gas explosion in Piper No. 2 killed 6 miners and injured 12. Among the dead were Peter Costello, Steve Memeth, Matt Elzt, John Stone, Louise Yanko, and Rich Smith (Negro). The second accident, which occurred in Piper No. 2 in May 1925, killed 6 miners. Their deaths were caused by an accumulation of "black damp" in an unused section of the mine. This section had been closed for two months following a fire in March. The miners – Fred Bashmen, John Wright, L.H. Horton, Steve Scott, Jeff Warren, and Eli Lucan – had entered the mine to ascertain whether the fire had been extinguished. A second party found their bodies approximately 700 yards from the entrance to the heading. Piper No. 1 was sealed in 1935 due to a fire (Cahaba Trace Commission 2000; Birmingham Public Library 2011).

A 1934-35 strike organized by the United Mine Workers Union brought substantial conflict to Piper, Coleanor, and several other mining towns. Both Piper and Coleanor were occupied by the Alabama National Guard during the strike (Cahaba Trace Commission). James W. Walker provides a detailed history of Piper in his 1993 "***The Struggle and the Joy: An American Coal Town, Piper, Alabama***". A copy of the Walker book has been requested for examination through the FWS's National Conservation Training Center Library's inter-library loan system. A more definitive history of the Piper and Coleanor area is being preparation for the Refuge's use.

The town of Piper no longer exists. Its only reminders, beyond the historic mining landscape, are a historical marker erected by the Cahaba Trace Commission and former residents of Piper and Coleanor in 2000 and several houses located northeast of the Refuge. The highwall and associated trailings runs parallel to the road leading to the coal tipple. A series of maps dating from 1899, 1934, and 1980, and the 1950 aerial photograph of the area show the rise and decline of the town between 1899 and 1980 (Figs11-17).

Archaeological investigations are not warranted or recommended, but monitoring is recommended for those phases of work at or near the sites of the town and the tipple. The proposed reclamation will have "no adverse effect" upon any of the Refuge's or the County's historic properties. The reclamation, once completed, will reduce the public safety threats, as well as substantially reduce or alleviate surface erosion that threatens the integrity of the archaeological sites and historic industrial landscape associated with the town of Piper. Re-establishment of longleaf pine, native grasses, and shrubs facilitates soil conservation. Covering the coal tipple's gob pile and back-filling of the entrance to Piper Mine No. 3 represents appropriate treatments that protect these features of the historic industrial site and landscape. Back-filling of the mine portal facilitates the re-establishment of the area's earlier hydrology, eliminates a potential source of contaminants, and eliminates a safety hazard.

The FWS would appreciate your timely review. Should you require additional information, please do not hesitate to contact me at (843) 784-6310 or at richard_kanaski@fws.gov.

Sincerely,

Richard S. Kanaski

Re: AHC 12-1289
Piper High Wall Reclamation Project
Cahaba National Wildlife Refuge
Bibb County, Alabama

Dear Mr. Kanaski:

Upon review of the information forwarded by your office, we agree that the proposed project should not affect any cultural resources listed on or eligible for the National Register of Historic Places (NRHP). We also agree that due to the potential significance of the Little Cahaba Coal Company "tipple" and No. 3 Mine opening, activities near these resources should be monitored to ensure their safety.

We appreciate your efforts on this project. Should you have any questions, please contact Greg Rhinehart at 334-230-2662.

Truly yours,

Elizabeth Ann Brown

REPLY TO
ATTENTION OF:

September 17, 2012

Inland Section North
Regulatory Division

SUBJECT: Nationwide Permit Authorization - Permit Number SAM-2011-01373-CTM, Department of Industrial Relations, Piper II Reclamation Project

Department of Industrial Relations
Abandoned Mine Lands
Attention: Mr. Michael Vinson
11 West Oxmoor Road, Suite 100
Birmingham, Alabama 35209

Dear Mr. Vinson:

This letter is in response to your application for a Department of the Army (DA) permit to impact 0.35 acres of wetlands in association with the reclamation of property that was left un-reclaimed during previous mining activities at the site. The project is located in Section 10, Township 24 North, Range 10 East (N 33.082678, W 87.058113) Bibb County, Alabama.

DA authorization is necessary because your project will involve the placement of fill material into jurisdictional waters of the United States, regulated under Section 404 of the Clean Water Act. The project will involve the placement of fill into 0.35 acre of wetlands at the project site in association with the reclamation of the site. Mitigation will not be required because of the nature of the project and the minimal amount of impacts associated with the project.

Based upon the information and plans you provided, we hereby verify that the work described above, which would be performed in accordance with the received drawings, is authorized by Nationwide Permit (NWP) 37 in accordance with 33 CFR Part 330 of our regulations. This NWP and its associated Regional and General Conditions can be viewed at our website www.sam.usace.army.mil/RD/reg. You must comply with all of the special and general conditions of this authorization or you may be subject to enforcement action. In the event you have not completed construction of your project within the specified time limit, a separate application or re-verification may be required.

Our verification of this NWP authorization is valid for 2 years from the date of this letter unless the NWP is modified, reissued, or revoked prior to that date. If the authorized work has not been completed by that date, please contact us to discuss the status of your authorization. Failure to comply with all terms and conditions of this NWP verification invalidates this authorization and could result in a violation of Section 404 of the Clean Water Act.

This letter of authorization does not obviate the necessity to obtain any other Federal, State, or local permits, which may be required. Further, please note General Condition 30 requires that you submit a signed certification to us once any work has commenced and when the work and required mitigation are completed. Please complete and submit the attached Notification of Commencement of Work when work has begun and the attached Compliance Certification form to this office within 60 days of completion of the authorized work.

A copy of this authorization is being provided to the Alabama Department of Environmental Management, Attention: Mr. Richard Hulcher, Field Operations Division, 1400 Coliseum Boulevard, Montgomery, Alabama 36110.

Please contact me at 205-290-9096 and refer to File Number SAM-2011-01373-CTM if you have any questions. For additional information about our Regulatory Program, visit our web site at www.sam.usace.army.mil/RD/reg, and please take a moment to complete our customer satisfaction survey while you are there. Your responses are appreciated and will allow us to improve our services.

Sincerely,

Courtney Shea

Dear Mr. Mapp:

The Piper II AML Reclamation Project is located in Bibb County, Alabama and will not have any reclamation work or construction activities performed in any part of the Cahaba River which lies to the southwest of the project limits.

Please advise me if any additional information is required or if you have any questions about the Piper II project.

Sincerely,

Michael H. Vinson, PCE II

IV. PROPOSED SCHEDULE

Anticipated Activity Schedule: **Commencement Date:** 09/01/11 **Completion date:** 04/01/12

Area of the Permitted Site: **Total area in acres:** 35 **Disturbed area in acres:** 35

V. VIOLATION HISTORY

Identify every Notice of Violation (NOV), Administrative Order, Directive, or Litigation filed by ADEM or EPA during the three year (36 months) period preceding the date on which this form is signed issued to the operator, owner, registrant, partner, parent corporation, subsidiary or LLC Member. Indicate the date of issuance, briefly describe alleged violation, list actions (if any) to abate alleged violation, and indicate date of final resolution:
NONE

VI. MAP SUBMITTAL

☒ Yes ☐ No A 7.5 minute series USGS topographic map(s) or equivalent map (s) is attached according to the instructions beginning on Page 3.
If "No", explain:_____

VII. PROPOSED ACTIVITY(S) TO BE CONDUCTED

If Non-Coal, Non-Metallic Mining, Recovery, or Construction Material Management Site: ☐ Dirt-Chert ☐ Sand-Gravel ☐ Shale-Clay ☐ Crushed-Dimension Stone ☒ Other Reclamation of Disturbed Area ☒ Other Excavation ☒ Other Placement of fill

Primary SIC Code 1629 Brief Description Construction, Noncoal Mining, or Materials Management Activity:

This Abandoned Mine Project will eliminate a dangerous highwall by backfilling, grading, stabilizing, installing erosion control devices and revegetating mine spoil with grasses and planting of pine seedlings.

VIII. RECEIVING WATERS

List name of receiving water(s), latitude & longitude (decimal or deg., min., sec) of location(s) that run-off enters the receiving water, total number of disturbed acres, the total number of drainage acres which will drain through each treatment system of BMP, and the waterbody classification.
If receiving water is designated as ONRW and/or Tier 1 waterbody, attach/submit copy of CBMPP.

Receiving Water	Latitude	Longitude	Disturbed Acres	Drainage Acres	Waterbody Classification	ONRW Y or N	TIER 1 Y or N
Drainage will flow into a mine opening at the base of the dangerous highwall	33° 04' 57"	87° 03' 29"	35	520	N/A	N/A	N/A

IX. MODIFICATION & RE-REGISTRATION - CONTINUING EDUCATION & INSPECTION INFORMATION

☐ Yes ☒ No **Required inspections/monitoring by QCP/QCI have been performed and records retained. If "No", explain:**
Proposed Facility at the Piper II AML project.

List name(s) and designation/certification #s of QCPsQCIs that performed required inspections/monitoring:
AML Inspectors under the direction of Michael H. Vinson, PE License No. 12310

X. QUALIFIED CREDENTIALED PROFESSIONAL (QCP) CERTIFICATION

"I certify under penalty of law that a comprehensive Construction Best Management Practices Plan (CBMPP) Plan for the prevention and minimization of all sources of pollution in stormwater and authorized related process wastewater runoff has been prepared under my supervision for this site/activity and associated regulated areas/activities, utilizing effective BMPs from the Alabama Handbook for Erosion Control, Sediment Control, And Stormwater Management On Constructions Sites and Urban Areas, Alabama Soil and Water Conservation Committee, as amended (ASWCC). If the CBMPP is properly implemented and maintained by the registrant, discharges of pollutants in stormwater runoff can reasonable be expected to be effectively minimized to the maximum extent practicable according to the requirements of ADEM Administrative Code Chapter 335-6-12. The CBMPP describes the pollution abatement/prevention management and effective structural & nonstructural BMPs that must be fully implemented and regularly maintained as needed at the registered site in accordance with sound sediment and erosion practices to ensure the protection of water quality."

QCP Designation/Description: Professional Engineer

Address: 11 W. Oxmoor Road, Suite 100, Birmingham, AL 35209 **Registration/Certification:** PE License No. 12310

ne and Title (type or print): Michael H. Vinson / PCE II **Phone Number:** (205) 945-8671

Signature: Michael H Vinson **Date Signed:** 05-20-11

XI. OPERATOR - RESPONSIBLE OFFICIAL SIGNATURE

Pursuant to ADEM Administrative Code Rule 335-6-6-09, t his NOR must be signed by a Responsible Official of the registrant who is the operator, owner, the sole proprietor of a sole proprietorship, a general/controlling member or partner, a ranking elected official or other duly authorized representative for a unit of government; or an executive officer of at least the level of vice-president for a corporation, having overall responsibility and decision making for the site/activity. "I certify under penalty of law that this form, the CBMPP, and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the qualified credentialed professional (QCP) and other person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted, is to the best of my knowledge and belief, true, accurate, correct, and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine or imprisonment for knowing violations. I certify that this form has not been altered, and if copied or reproduced, is consistent in format and identical in content to the ADEM approved form. I further certify that the proposed discharges described in this registration have been evaluated for the presence of any non-construction and/or coal/mineral mining, stormwater, or process wastewaters have been fully identified."

Appendix E

Selected USGS and ADEM Surface Water Quality Monitoring Sites in the Region of Hydrologic Influence (RHI) for Cahaba River NWR, AL.

Source: [USGS] U.S. Geological Survey. 2013. U.S. Geological Survey. National Water Information System. Accessed 2013. Available from: http://waterdata.usgs.gov/nwis.

The USGS uses parameter groups to organize groupings of measured constituents, which are identified by parameter codes. In this appendix the parameter groups are shown for each site with water quality monitoring samples in the RHI. The following is a table of the parameter groups for these sites, along with example constituents. For more information see http://help.waterdata.usgs.gov/codes-and-parameters/parameters.

Parameter Group	Example Constituents
Inorganics, Minor, Metals	Metals not considered "Major" (see below)
Inorganics, Minor, Non-Metals	Cyanide, Arsenic, Selenium, Antimony, etc.
Information	Location, Altitude, Temperature, etc.
Inorganics, Major, Metals	Calcium, Magnesium, Sodium, Potassium
Inorganics, Major, Non-Metals	Hydrogen, Oxygen, CO2, Alkalinity, Acidity, etc.
Microbiological	Total coliform, Fecal coliform, E.coli, etc.
Nutrients	Nitrogen and Phosphorus (various forms)
Physical	Stream velocity, turbidity, hardness, etc.
Biological	Biomass, Chlorophyll-a, Productivity, etc.
Organics, Other	Organics other than pesticides and PCBs
Organics, Pesticide	Atrazine, DDT, Dieldrin, Endosulfan, etc.
Sediment	Bed sediment, suspended sediment, etc.
Organics, PCBs	PCB congeners, Aroclor, etc.
RAD Sediment	Radiochemical parameters

Begin and end sampling dates vary for each individual parameter; the range shown in this appendix covers all water quality parameters sampled at the site.

Appendix G

USGS Groundwater Quality Monitoring Sites in the Region of Hydrologic Influence (RHI) for Cahaba River NWR, AL

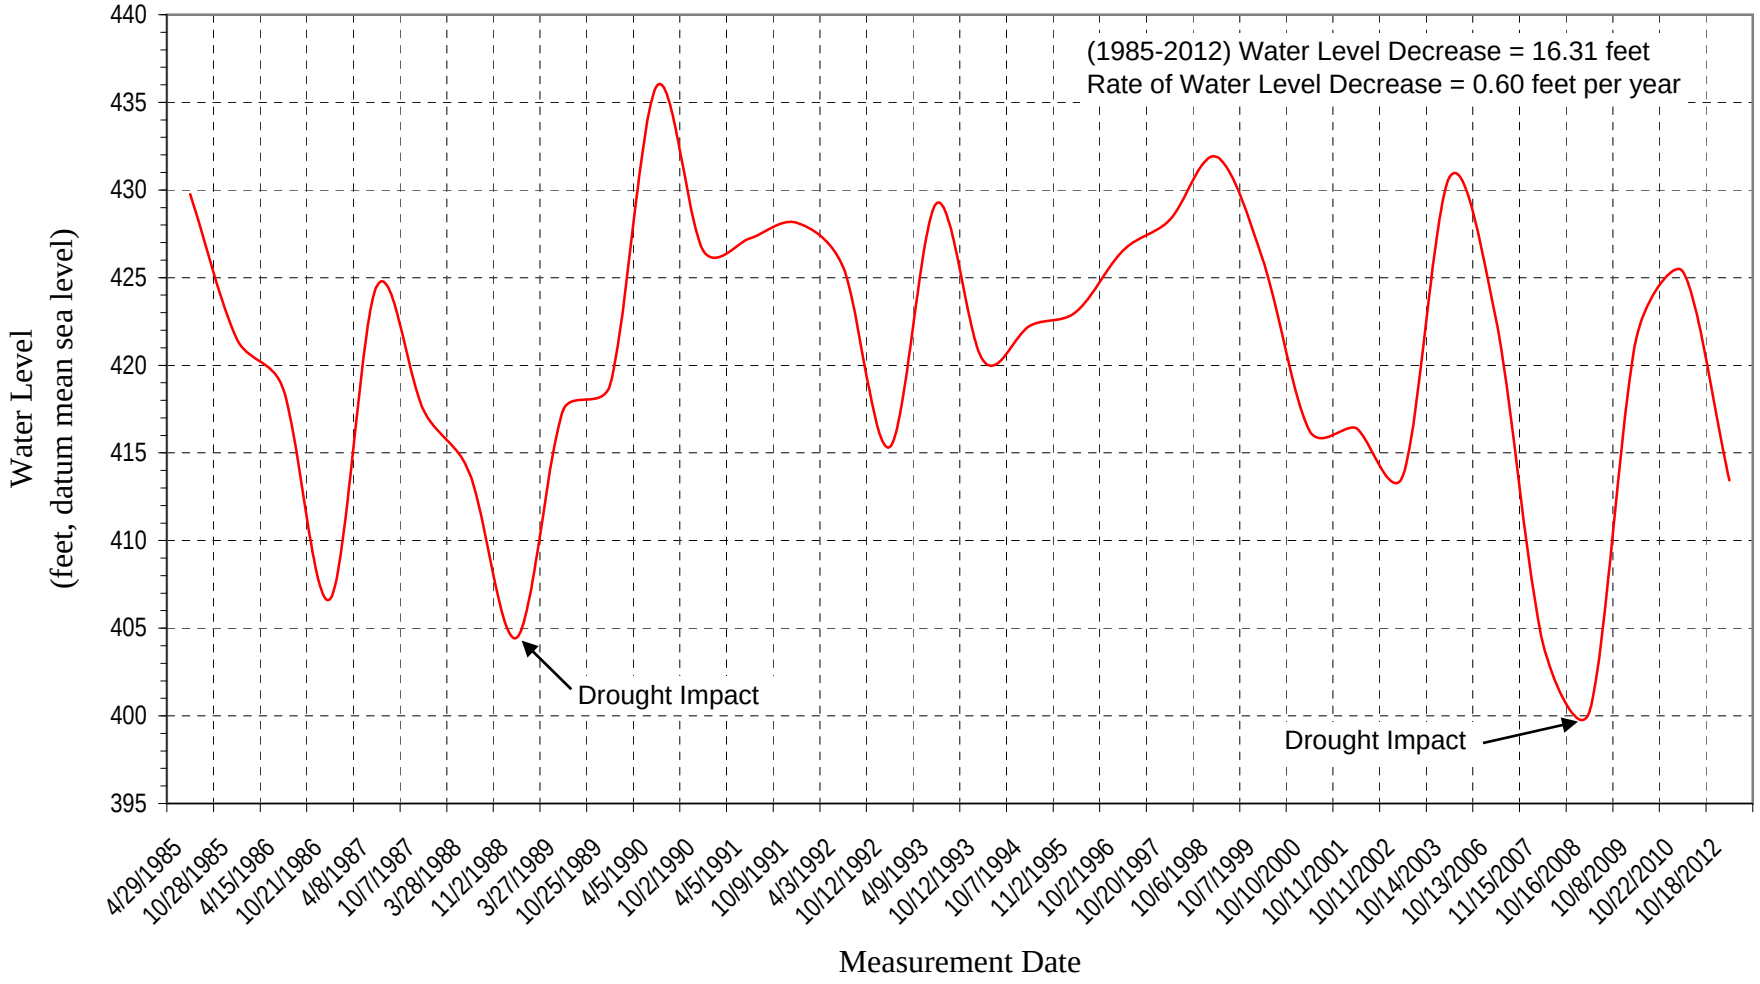
Source: [USGS] U.S. Geological Survey. 2013. U.S. Geological Survey. National Water Information System. Accessed 2013. Available from: http://waterdata.usgs.gov/nwis.

The USGS uses parameter groups to organize groupings of measured constituents, which are identified by parameter codes. In this appendix the parameter groups are shown for each site with water quality monitoring samples in the RHI. The following is a table of the parameter groups for these sites, along with example constituents. For more information see http://help.waterdata.usgs.gov/codes-and-parameters/parameters.

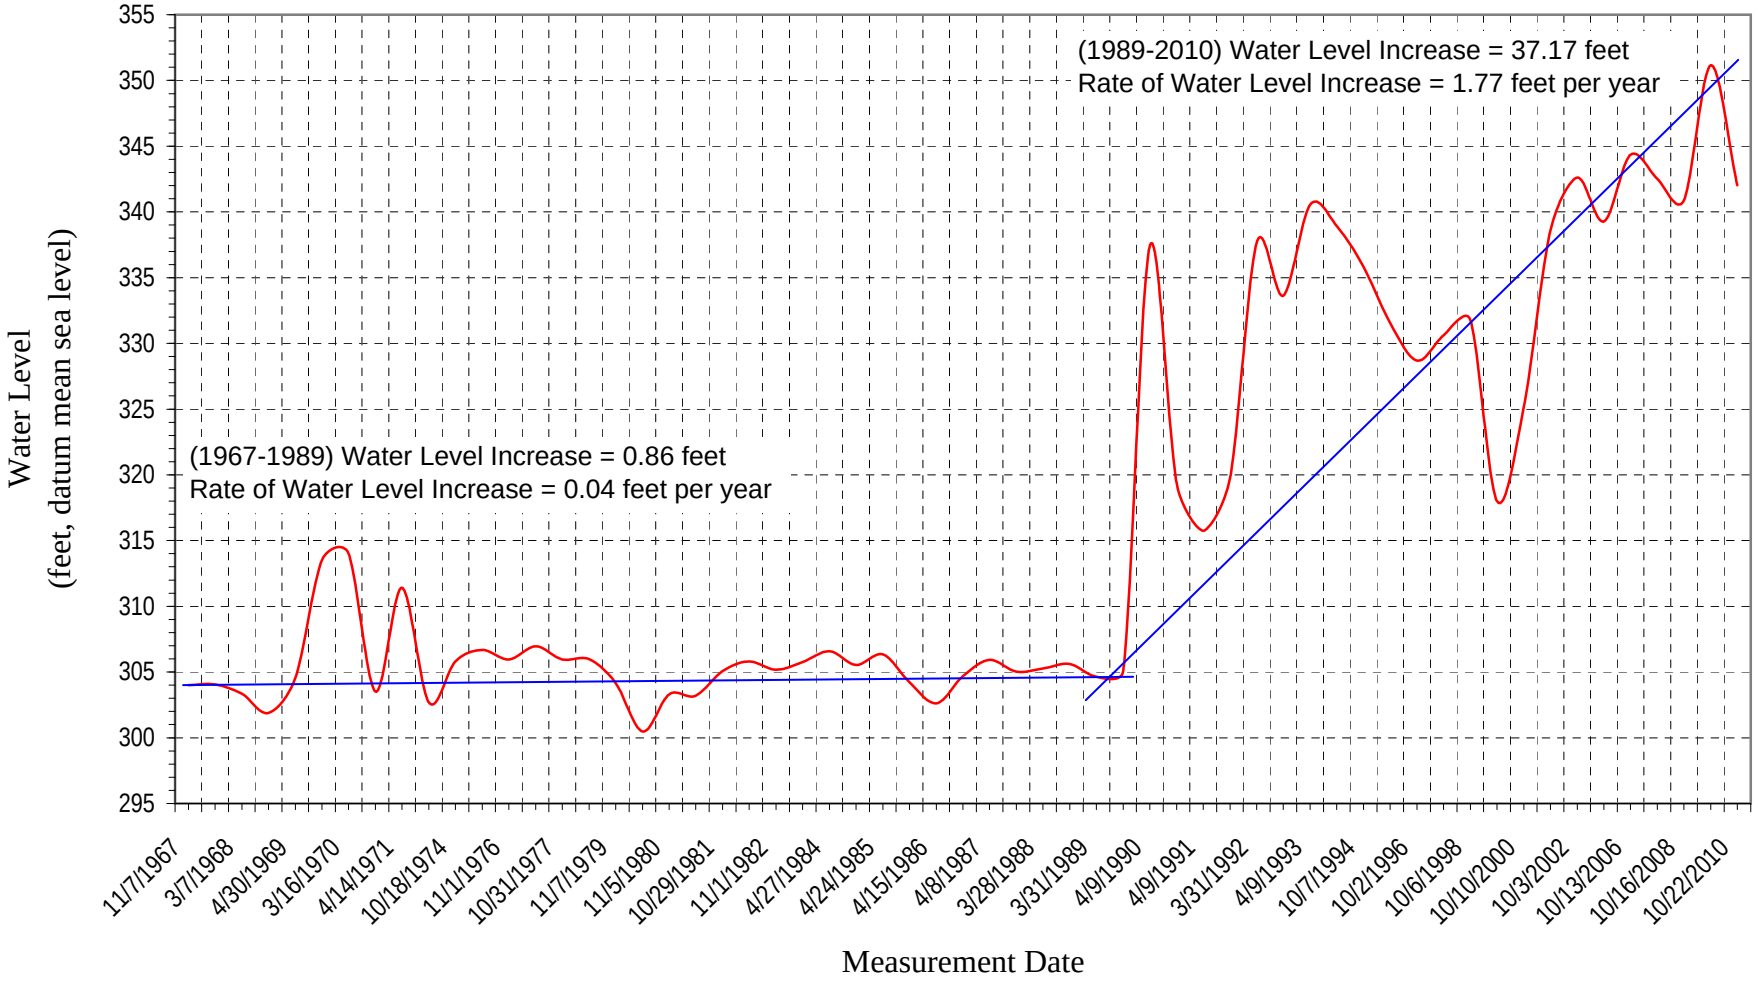
Parameter Group	Example Constituents
Inorganics, Minor, Metals	Metals not considered "Major" (see below)
Inorganics, Minor, Non-Metals	Cyanide, Arsenic, Selenium, Antimony, etc.
Inorganics, Major, Metals	Calcium, Magnesium, Sodium, Potassium
Inorganics, Major, Non-Metals	Hydrogen, Oxygen, CO2, Alkalinity, Acidity, etc.
Nutrients	Nitrogen and Phosphorus (various forms)
Physical	Stream velocity, turbidity, hardness, etc.
Organics, Other	Organics other than pesticides and PCBs
Organics, Pesticide	Atrazine, DDT, Dieldrin, Endosulfan, etc.
Radiochemical	Alpha/beta particles, Radium, Uranium, etc.

Begin and end sampling dates vary for each individual parameter; the range shown in this appendix covers all water quality parameters sampled at the site.

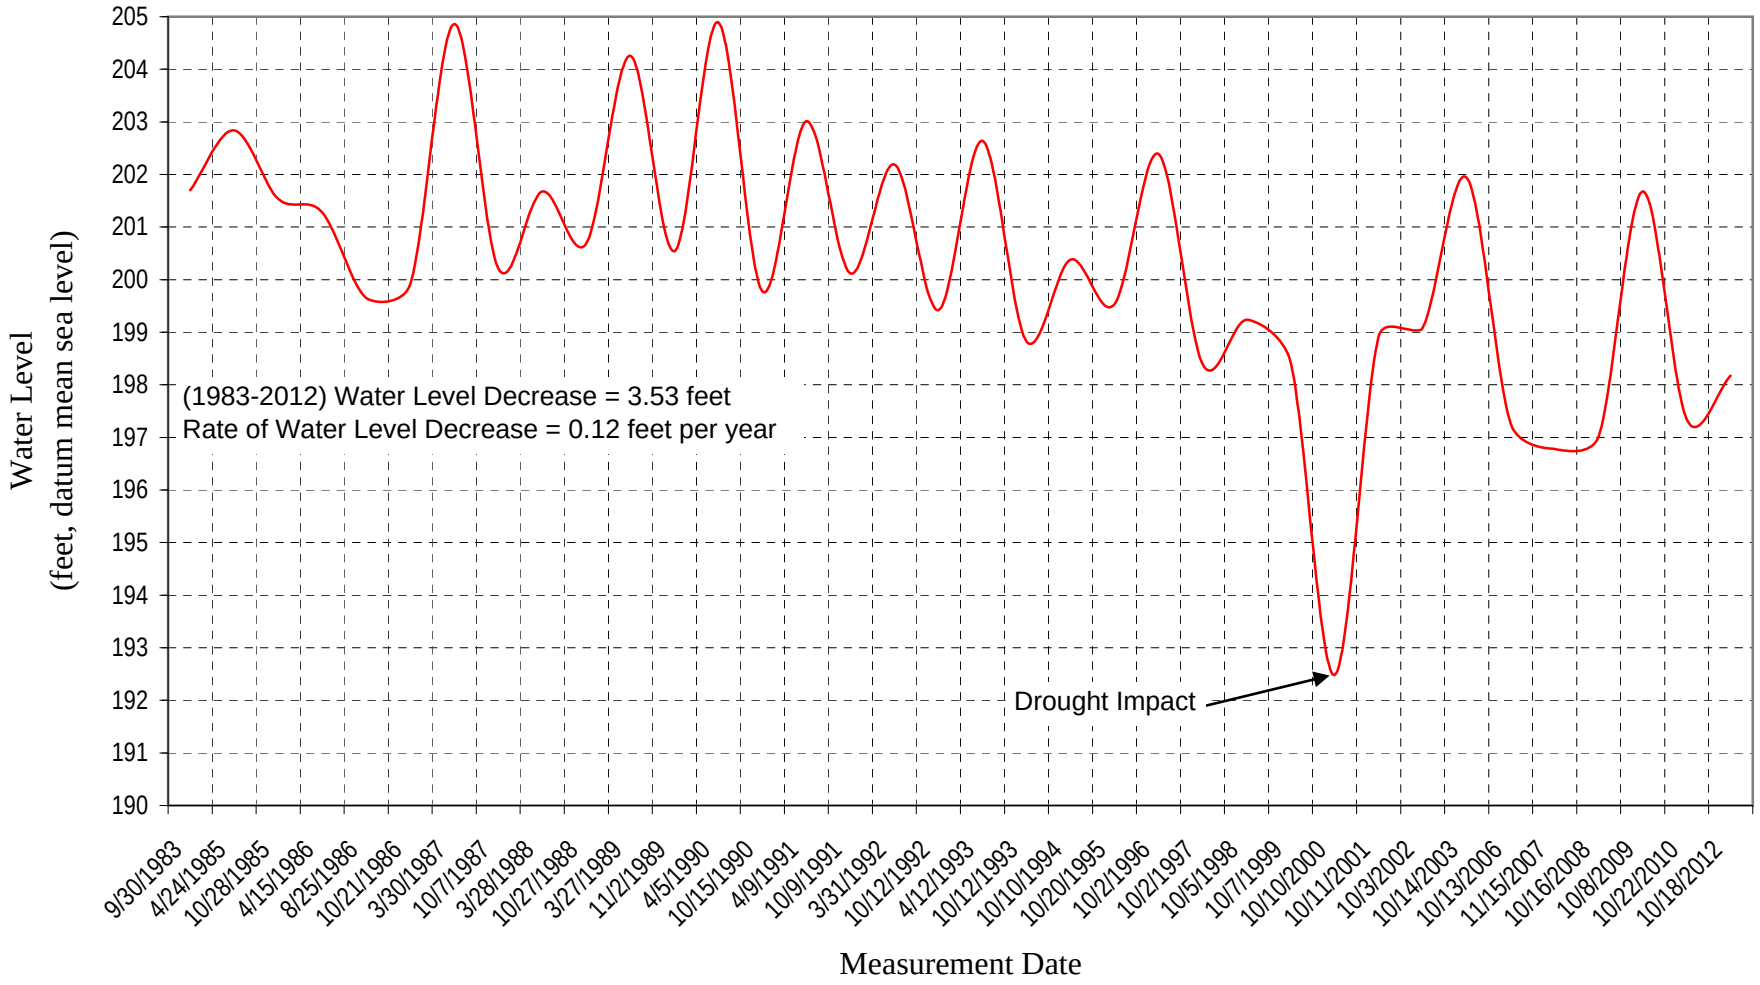
Hydrograph of Unused Well C-1, Bibb County
Chepultepec Dolomite of Early Ordovician Age
Depth 192 ft



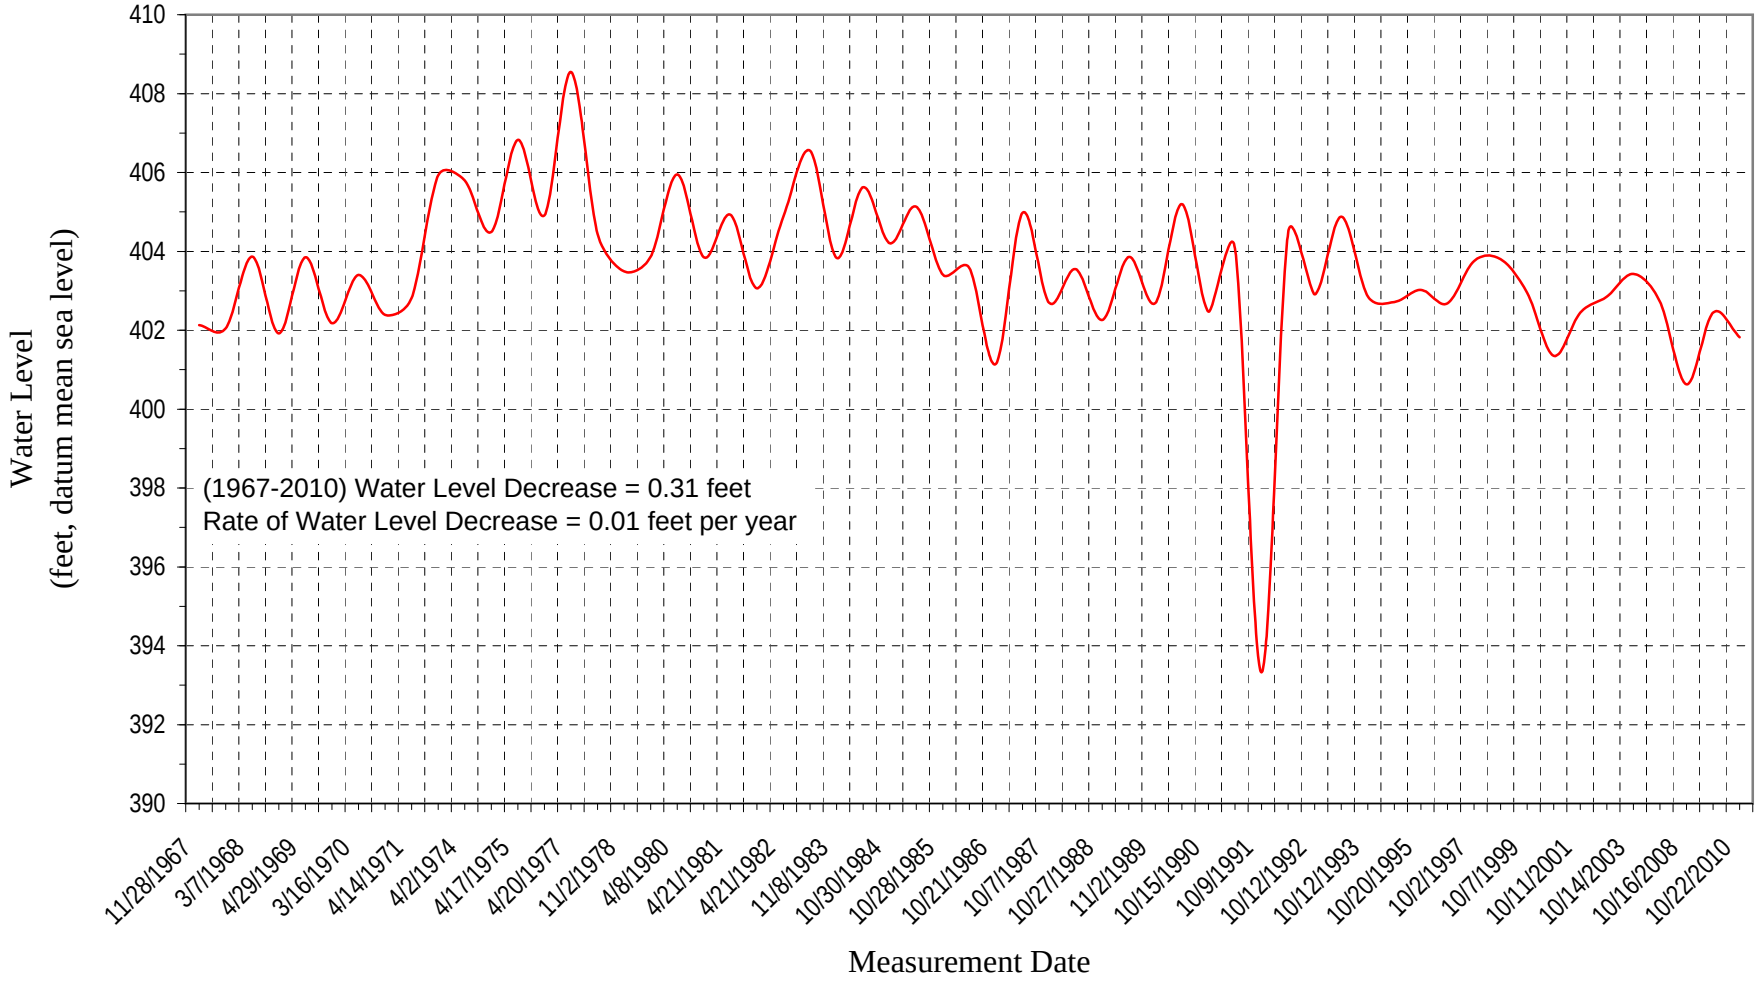
Hydrograph of Domestic Supply Well L-4, Bibb County
Sand of Coker Formation of Late Cretaceous Age
Depth 176 ft



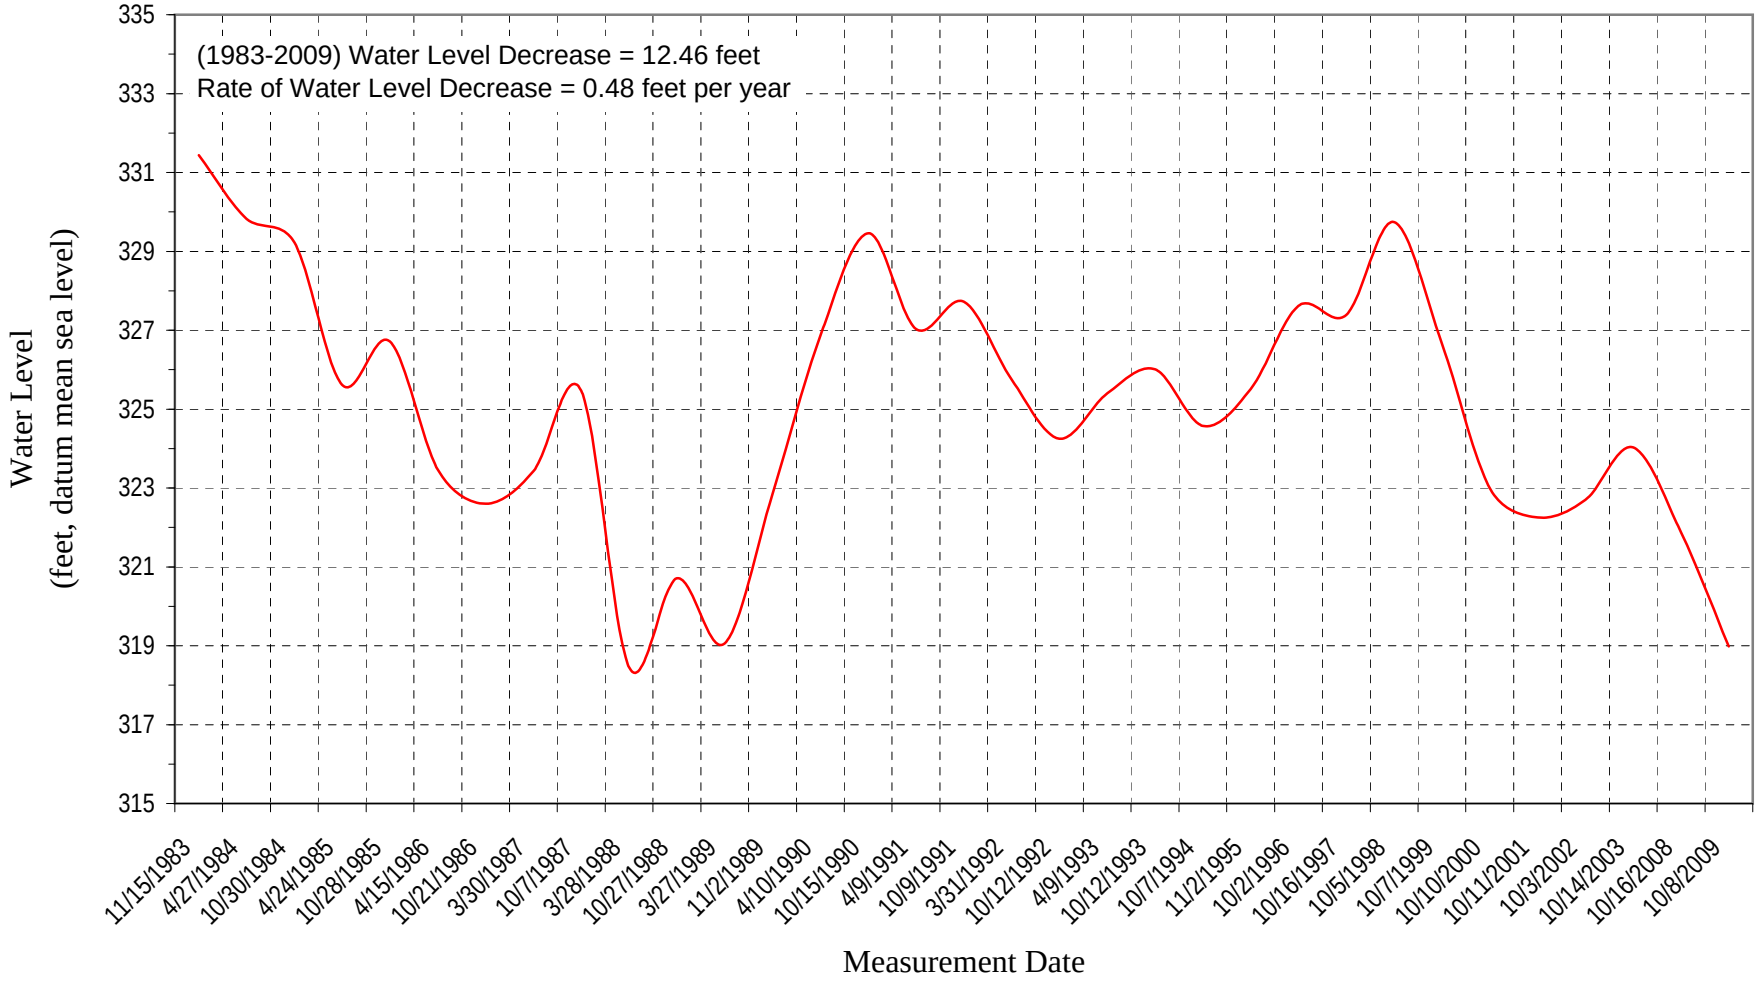
Hydrograph of Unused Well O-5, Bibb County
Copper Ridge Dolomite of Late Cambrian Age and Chepultepec Dolomite of Early Ordovician Age
Depth 404 ft



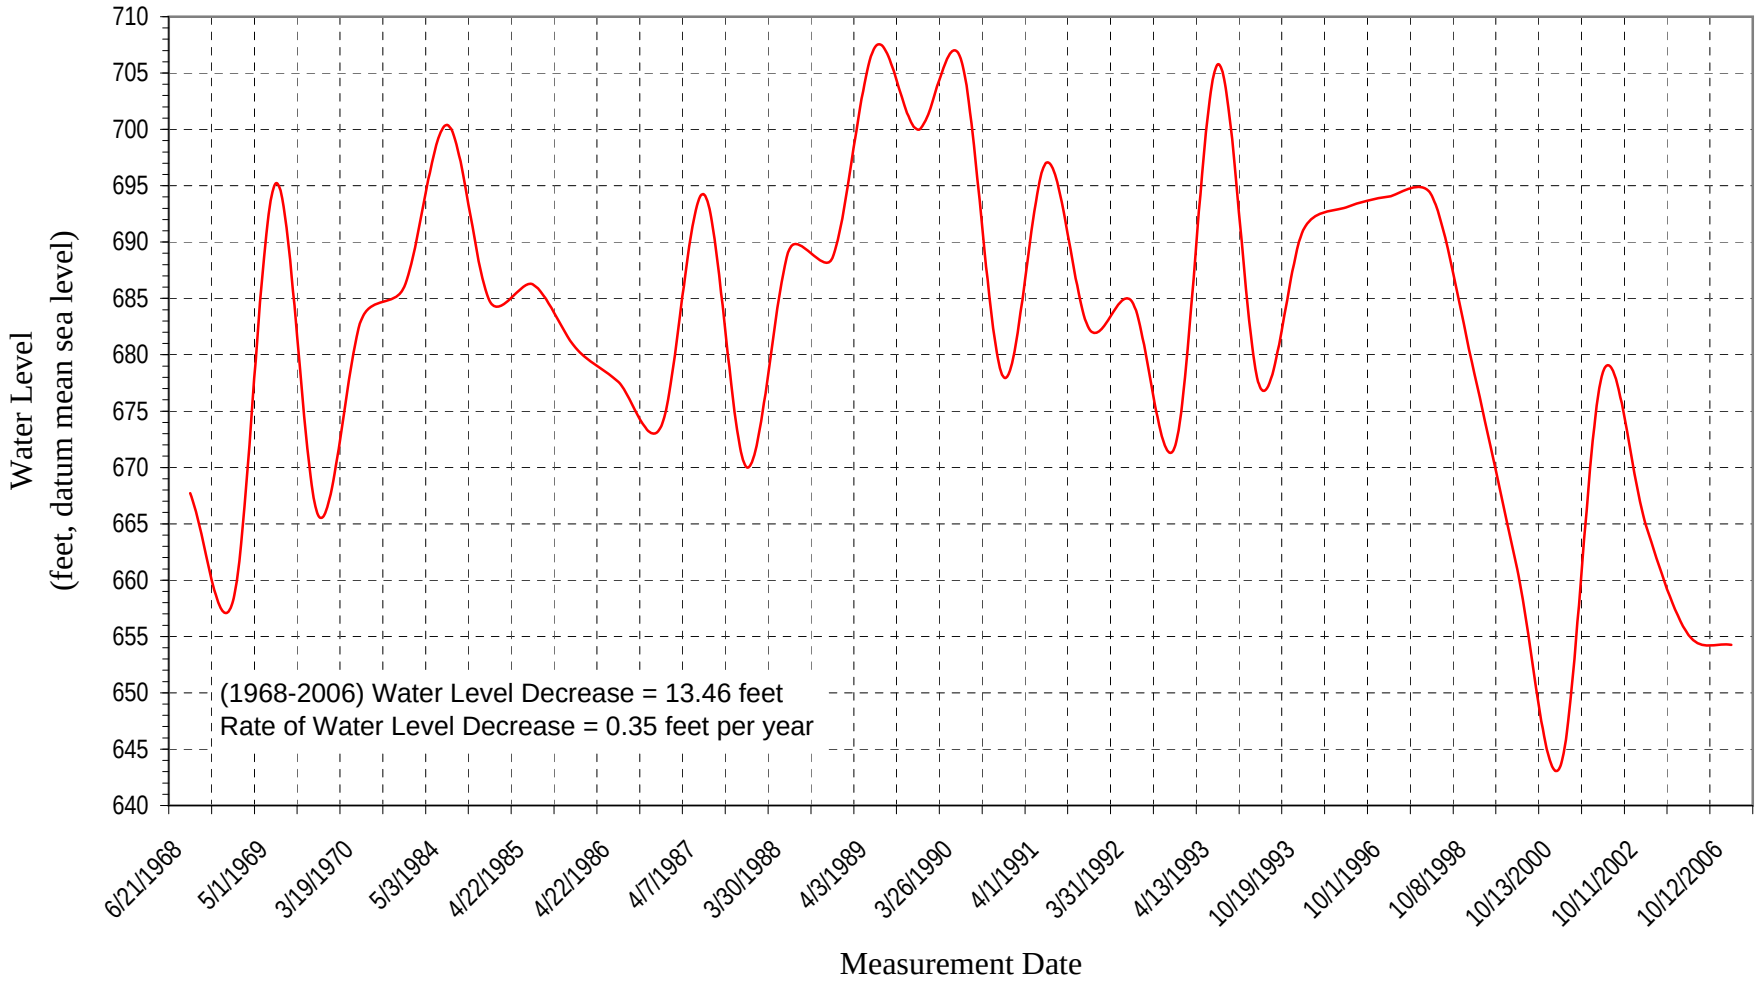
Hydrograph of Domestic Supply Well T-6, Bibb County
Sand of Coker Formation of Late Cretaceous Age
Depth 143 ft



Hydrograph of Domestic Supply Well W-3, Bibb County
Sand of Coker Formation of Late Cretaceous Age
Depth 175 ft



Hydrograph of Public Supply Well L-5, Jefferson County
Fort Payne Chert of Early Mississippian Age
Depth 186 ft



Appendix H

GSA Groundwater Well Hydrographs within or near the Region of Hydrologic Influence (RHI) for Cahaba River NWR, AL.

March 7, 1978

Honorable George C. Wallace
Governor of Alabama
Montgomery, Alabama

Dear Governor Wallace:

I have the honor to transmit herewith Map 144, "Water Availability in Bibb County, Alabama" one of the special series of maps that we are issuing on water availability for each of our counties.

The largest sources of water in Bibb County are from wells tapping limestone, dolomite, and sand aquifers, and water from the Cahaba and Little Cahaba Rivers. Potential sources of 0.5 mgd (million gallons per day) or more per well are available from limestone and dolomite aquifers in topographic lows and along faults in the central part, and sand aquifers in the southern part of the county. The total average flow of all streams in the county is 1,260 mgd of which 590 mgd originates within the county.

The Cahaba River at Centreville has an average flow of 1,000 mgd and a 7-day Q_2 of about 130 mgd. The Little Cahaba River near Brierfield has an average flow of 130 mgd and a 7-day Q_2 of about 30 mgd.

Water from aquifers and streams in Bibb County is generally of suitable chemical quality for most uses. Water from sand and sandstone aquifers is generally soft to moderately hard and generally contains iron in excess of 0.3 mg/l (milligrams per liter). Water from limestone and dolomite aquifers is generally moderately hard to hard and has an iron content of less than 0.3 mg/l. Water from streams is generally soft to moderately hard and has a dissolved solids content of less than 150 mg/l.

This series of reports and maps has been prepared to aid in the development of Alabama's important water resources.

Respectfully,

Thomas J. Joiner
State Geologist

WATER AVAILABILITY IN BIBB COUNTY, ALABAMA

By L. V. Causey, J. R. Willmon, and J. S. Ellard

ABSTRACT

The largest sources of water in Bibb County in central Alabama are limestone, dolomite, and sand aquifers, and Cahaba and Little Cahaba Rivers. Potential sources of 0.5 mgd (million gallons per day) or more per well are limestone and dolomite aquifers in topographic lows in the northern part of the county; limestone and dolomite aquifers in topographic lows and along faults in the central part; and sand aquifers in the southern part. The total average flow of all streams in the county is about 1,260 mgd, of which 590 mgd originates within the county. The Cahaba River at Centreville has an average flow of 1,000 mgd and a 7-day Q_2 (median annual 7-day low flow) of about 130 mgd. The Little Cahaba River near Brierfield has an average flow of 130 mgd and a 7-day Q_2 of about 30 mgd.

Wells in northern and central parts of the county are rarely drilled deeper than 300 feet. Wells in the southern part of the county generally range in depth from 150 feet in the Cahaba River valley to 800 feet in upland areas.

Water from aquifers and streams in Bibb County is generally of suitable chemical quality for most uses. Water from sand and sandstone aquifers is generally soft to moderately hard and generally contains iron in excess of 0.3 mg/l (milligrams per liter). Water from limestone and dolomite aquifers is generally moderately hard to hard and has an iron content less than 0.3 mg/l. Water from streams is generally soft to moderately hard and has a dissolved-solids content of less than 150 mg/l.

The average use of water in Bibb County in 1969 was about 1.4 mgd which is less than 1 percent of the quantity available.

INTRODUCTION

The investigation of the availability of water in Bibb County is a part of a statewide study of the geology and availability of water resources in Alabama being conducted by the U.S. Geological Survey in cooperation with the Geological Survey of Alabama. The State was divided into seven study areas corresponding generally to major river basins. The work in each study area is being done by individual counties and resulting reports are being published on the basis of county units. The boundaries of the seven areas and the status of studies in each area are shown on figure 1. This report is one of 10 water-availability reports being prepared for counties in the east-central area of Alabama (Ala-35-C on fig. 1).

The purpose of this report is to present graphically and pictorially general information on the availability of water in Bibb County. The report can be used (1) to quickly appraise the water resources of the county and (2) for comparison with similar reports for other counties in Alabama. Information contained in earlier reports and information collected since the earlier reports were prepared were used in preparing this report.

Acknowledgment is made to water-works superintendents, city and county officials, and local citizens for providing information on wells, springs, and water use. Special appreciation is expressed to well drilling companies for furnishing well cuttings, drillers' logs, and other information concerning well construction and production.

WATER AVAILABILITY

Water in streams and in ground-water reservoirs underlying Bibb County is derived principally from precipitation which averages about 57 inches per year. Approximately 37 of the 57 inches of precipitation returns to the atmosphere by evapotranspiration. The remaining 20 inches, equivalent to 590 mgd (million gallons per day) for the entire county or 0.95 mgd per square mile, runs off and is available in streams. An additional 670 mgd is also available from inflow of streams.

The occurrence and availability of ground and surface water are governed

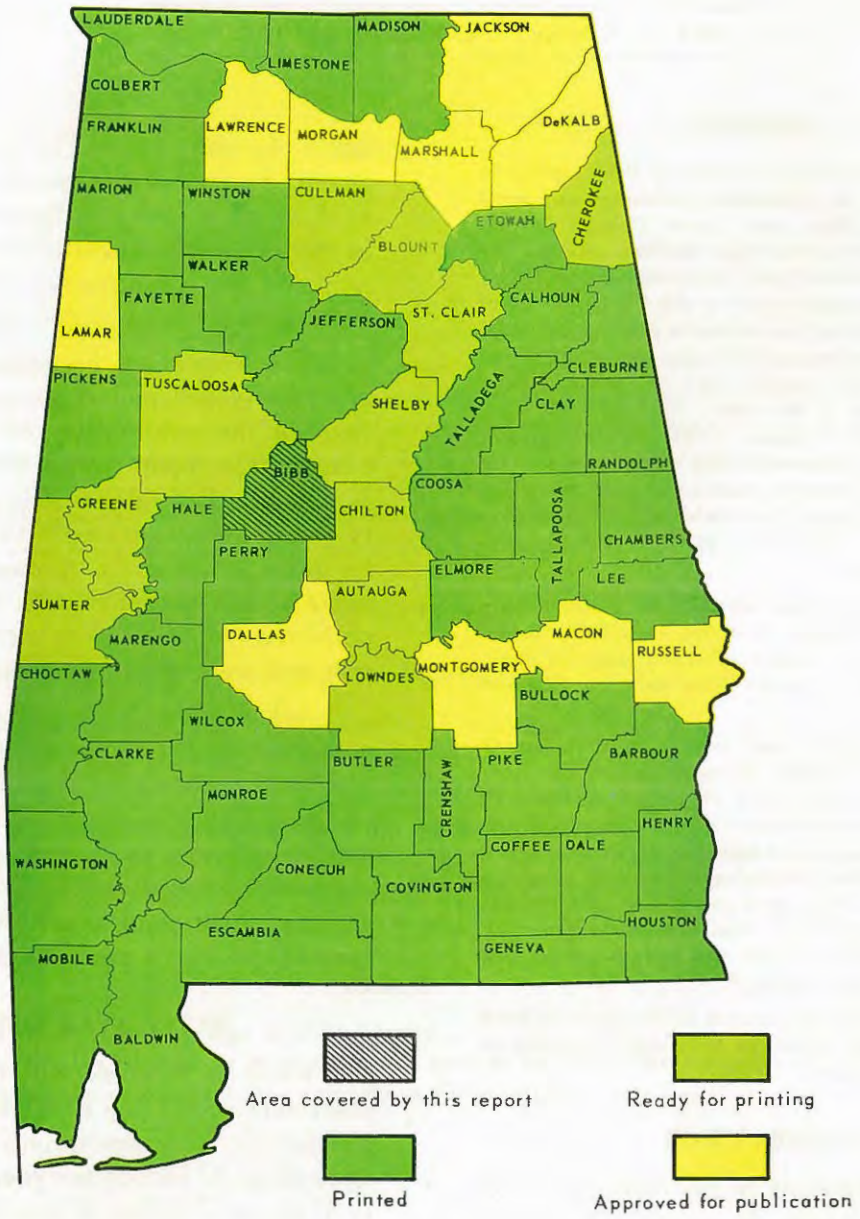

Figure 1.—Status of geologic and water-availability studies in Alabama.

largely by the physical characteristics of geologic formations. All geologic units that crop out in Bibb County contain beds of permeable sand, limestone, dolomite, sandstone, or sandy shale, that serve as natural conduits and reservoirs for water. These permeable beds, called aquifers, are sources of water for wells and springs and in areas of outcrop, they provide the low flow of streams.

GROUND WATER

An appraisal of the availability of ground water in Bibb County is shown on plate 1. Ranges of potential yields from individual wells are depicted by colors. Divisions between colored patterns, in general, coincide with changes in rock type, structure, and topography; however, the divisions between areas should be considered as zones rather than as abrupt lateral changes in the water-bearing characteristics of the rocks. Water-bearing units are designated primarily by rock types in this report for simplicity. Names of geologic units are also given in tables 1 aud 2 of the report to aid in comparing water in individual geologic units in Bibb County to that in the same units in other counties. The appraisal of the availability of ground water is based on data in table 1, on interpretations of subsurface geology and, in part, on hydrologic data from adjacent county studies.

Information on the geologic units underlying Bibb County was obtained as a part of the geologic study made as part of the water-resources study. However, the geologic report will be printed separately and is now in the process of being prepared.

Permeable limestone, dolomite, sand, sandstone, and sandy shale are sources of sufficient water for rural domestic supplies. A supply of 10 gpm (gallons per minute) is considered adequate for most domestic needs. The maximum depths necessary to drill a well in Bibb County that will produce 10 gpm generally are 100 to 200 feet in valley areas and 200 to 300 feet in upland areas.

The principal sources of large quantities of ground water in Bibb County are sand, limestone, and dolomite aquifers. The principal sand aquifer will yield 0.5 mgd or more per well in the southern part of the county. Limestone and dolomite aquifers in central and northern parts of the county generally will yield less than 0.5 mgd per well but locally will yield 0.5 mgd or more.

The elevation of the base of the principal sand aquifer is shown by contours on plate 1. To estimate the depth from the land surface to the base of the sand aquifer at a proposed well site, subtract the numerical value of the contour nearest the well site from the elevation above mean sea level of land surface at the well site. For example, if the elevation of the well site is 300 feet above mean sea level and the nearest contour for the aquifer is -100 (100 feet below mean sea level), the depth necessary to penetrate the entire aquifer would be 400 feet; however, if the nearest contour is 100 (100 feet above mean sea level), the depth would be 200 feet. Wells developed in the principal sand aquifer in the southern part of the county generally range in depth from 150 feet in the Cahaba River valley to 800 feet in upland areas. Wells developed in limestone, dolomite, and sandstone aquifers in northern and central parts of the county are rarely drilled deeper than 300 feet.

SURFACE WATER

Streamflow, depending on precipitation, consists of varying proportions of direct runoff and ground-water discharge. During high flow most of the streamflow consists of direct runoff and during low flow most of the streamflow consists of ground-water discharge.

High and low streamflow occur in seasonal patterns. Figure 2, a bar graph of

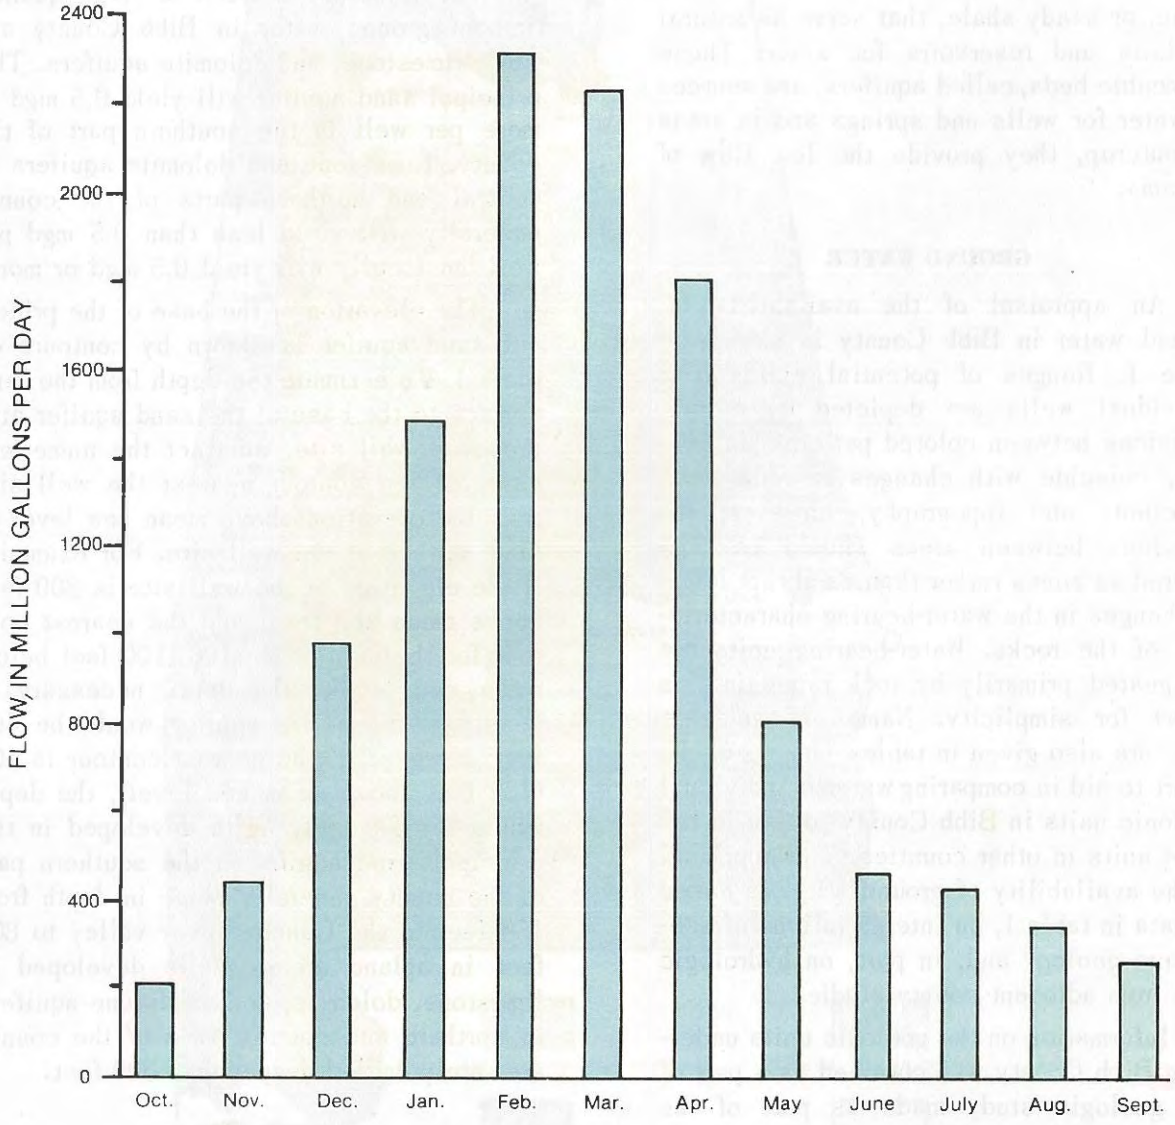

Figure 2.—Average daily flows by month of Cahaba River at Centreville, Alabama.

average daily flows by month of the Cahaba River at Centreville, shows the seasonal variations of streamflow. Streamflow is generally lowest in September and October during months of least rainfall and is highest from January through April during months of greatest rainfall.

The average flow of a stream is the arithmetic mean of all flows of record. In general, the longer the period of record the more accurate is the computed average flow. Average flow data in this report were adjusted to the base period 1940-65, a period including a reasonable balance of wet and dry years.

Average flows of streams in Bibb County are shown on plate 2. The average rate of runoff in the county is about 0.95 mgd per square mile or about 590 mgd for the entire county. The total average flow of all streams in the county is about 1,260 mgd.

Low-flow characteristics of streams may be described in several ways. A low-flow index that is used in this report is the 7-day Q_2 which is defined as the median anuual 7-day minimum flow. For streams that are not regularly gaged, this parameter can be satisfactorily evaluated from a relatively small amount of streamflow data. As a median value, it is a fairly stable parameter, being the average only of position in an array of items and hence unaffected by extreme values. Also as a median, it is a good measure of normal conditions. The recurrence interval for the median value in a series of annual events is always known, being equal to 2 years in any form of frequency distribution. Finally, the 7-day period of low flow is short enough to represent flow that is available for the most part without storage, yet is long enough to suppress the effects of abnormally low transient flows of little hydrologic significance that might result from occasional regulation or from infrequent natural events. Approximate ranges of 7-day Q_2's for streams in Bibb County are depicted on plate 2.

Cahaba River and Little Cahaba River are the largest sources of surface water in Bibb County. The Cahaba River at Centreville has an average flow of 1,000 mgd and a 7-day Q_2 of about 130 mgd. The Little Cahaba River near Brierfield has an average flow of 130 mgd and a 7-day Q_2 of about 30 mgd.

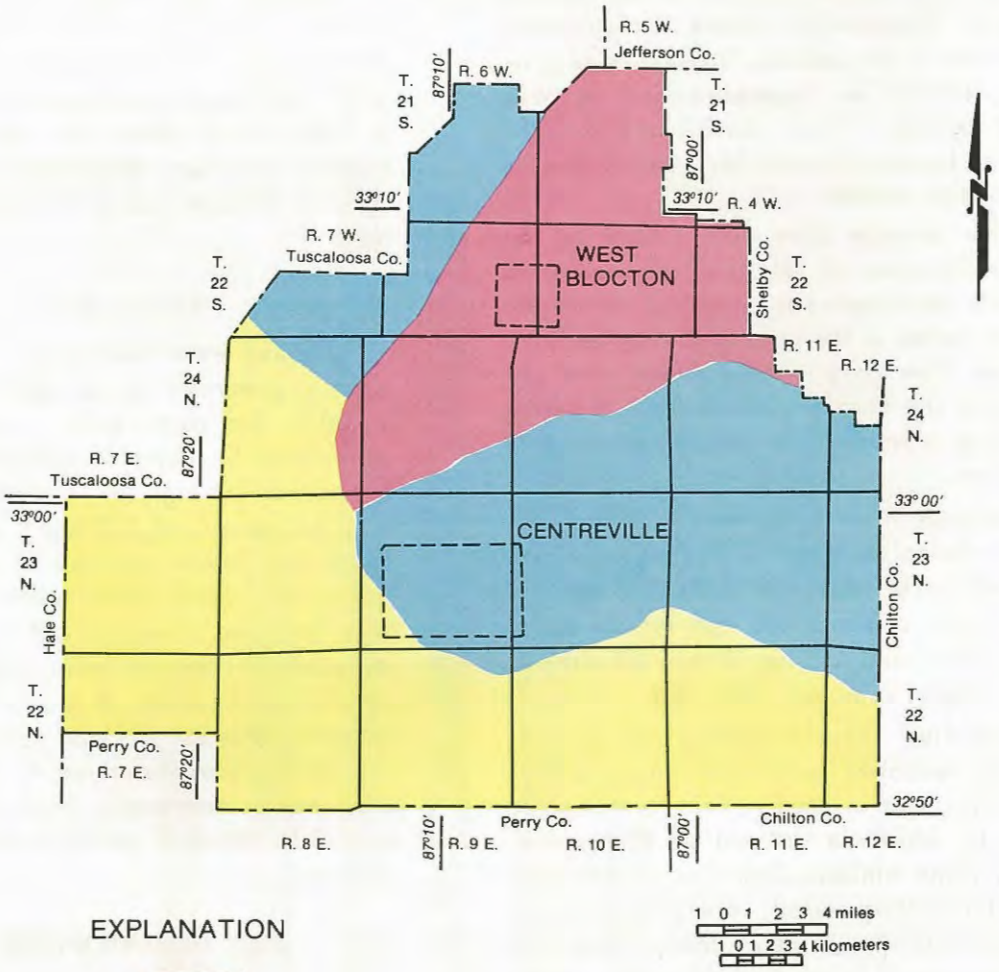
WATER QUALITY

Ground water and surface water in the county generally is of good quality and suitable for most uses. Locally, ground water may be objectionable for some uses because of its high iron content or hardness. Iron in excess of 0.3 mg/l (milligram per liter) may cause staining of plumbing fixtures and fabrics. Hard water is objectionable for some domestic and industrial uses because it increases soap consumption and may deposit scale in pipes and boilers. General terms used in this report to describe the hardness of water are as follows: soft, 0-60 mg/l; moderately hard, 61-120 mg/l; hard, 121-180 mg/l; and very hard, more than 180 mg/l.

GROUND WATER

The general distribution of iron content and hardness of water from aquifers in Bibb County is depicted by colors on figure 3. Chemical analyses of water from wells and springs shown on plate 1 are tabulated in table 2. An analysis of the data indicates that the dissolved-solids content is generally less than 300 mg/l; that water in sand, sandstone, and shale aquifers generally is soft to moderately hard and generally contains iron in excess of 0.3 mg/l; and that water in limestone and dolomite aquifers is generally moderately hard to hard and has an iron content that is less than 0.3 mg/l.

The temperature of water from springs and from wells 300 feet or less in depth in Bibb County ranges from 15° to 19° C (Celsius) or from 59° to 67° F (Fahrenheit).



EXPLANATION

Iron content generally less than 0.3 mg/l (milligrams per liter). Generally moderately hard to very hard (61 to more than 180 mg/l). Principal water-bearing rocks are limestone and dolomite.

Iron content generally exceeds 0.3 mg/l. Generally soft (0 to 60 mg/l). Principal water-bearing rock is sand.

Iron content exceeds 0.3 mg/l. Generally soft to moderately hard (O to 120 mg/l). Principal water-bearing rock is sandstone.

Figure 3.—Generalized distribution of iron content and hardness of ground water in Bibb County, Alabama.

SURFACE WATER

The chemical quality of surface water in Bibb County is significantly influenced by the geologic characteristics of the drainage basins. Water in streams that drain limestone and dolomite generally has a higher bicarbonate content and specific conductance and is harder than that in streams that drain sand, gravel, and clay. Also, the mineral content of the water generally is higher during periods of low streamflow than during periods of high streamflow. The dissolved-solids content (calculated from the specific conductance) is generally less than 150 mg/l; the chloride content less than 5 mg/l; and the hardness less than 140 mg/l.

Chemical analyses of surface water made since October 1967 are tabulated in table 3 and the locations of sampling sites are shown on plate 2. Chemical analyses of water collected earlier at those and other sites are included in several of the reports listed in the selected references.

WATER USE

Ground water from wells and springs is the source of all rural domestic, industrial, and public supplies in Bibb County and is a source for some livestock supplies. Most livestock supplies are obtained from surface-water sources.

Estimated average water use in the county in 1969 was about 1.4 mgd which is about 100 gallons per capita. Water use is less than 1 percent of that available. A summary of ground-water and surface-water use in Bibb County in 1969 is as follows:

Use	Source of supply	
	Ground water	Surface water
	(gallons per day)	
Rural domestic supplies	240,000	
Stock supplies	60,000	150,000
Industrial supplies	20,000	
Public supplies		
Brent	150,000	
Centreville	500,000	
Green Pond	18,000	
West Blocton	100,000	
Rural school supplies	12,000	
Belcher Lumber Co. mill homes	100,000	
Total	1,200,000	150,000

BASIC DATA

Table 1.—*Records of wells and springs in Bibb County*

Numbers correspond to those on plate 1.
Depth of well: Depths are given in feet below land surface; S indicates spring.
Water-bearing unit (rock type and geologic unit). Rock type: sc, sand; ls, limestone; dol, dolomite; ss, sandstone; sh, shale. Geologic unit: Cr, Rome Formation; Cc, Conasauga Formation; Cbf, Brierfield Dolomite; Ck, Ketona Dolomite; OCcu, Copper Ridge Dolomite and Chepultepec Dolomite undifferentiated; On, Newala Limestone; Oc, Chickamauga Limestone; Mf, Floyd Shale; IPpv, Pottsville Formation; Kck, Coker Formation.
Altitude: Determined by aneroid barometer.
Water level: Reported water levels are given in feet; measured water levels are given in feet and tenths.
Method of lift: C, cylinder; F, flow; J, jet; M, manual; N, none; S, submersible; T, turbine.
Use of water: D, domestic; I, Industrial; N, not used; P, public supply; S, stock.

[1] Approximate dissolved solids = specific conductance x 0.60.

Area	Principal water-bearing rock	Occurrence of water	Estimated yield per well	Most favorable test-drilling localities	General well depths
	Sand.	Interstitial voids in sand.	0.5 to 1.0 mgd	South of 100-foot contour; yields increase southward.	Wells completed in principal sand aquifer generally range from 150 feet below land surface in the valley south of Brent to 800 feet in the southwest corner of the county.
	Sand in south-central part of county; limestone and dolomite in north-central and northern parts.	Interstitial voids in sand; solution cavities in limestone and dolomite; fractured zones along faults.	0.1 to 0.5 mgd. Locally, the limestone and dolomite will yield more than 0.5 mgd.; however, more than one test well may be needed to obtain optimum yields.	South-central part of county; where saturated sand is thickest. North-central and northern parts of county; in topographic lows and along faults.	Generally less than 400 feet in south-central part of county; generally less than 300 feet in north-central and northern parts. Wells in south-central part may be completed in principal sand aquifer and (or) in underlying consolidated rock.
	Shale in east-central part of county Sandstone in northeastern part.	Joints; bedding planes; fractured zones along faults.	Less than 0.1 mgd. Locally, sandstone may yield as much as 0.2 mgd.	In topographic lows.	Generally less than 200 feet except where the rock is fractured. Sandstone and shale yield very little water below that depth.

(For ground-water quality, see figure 5 and table 2.)

EXPLANATION

Domestic or stock well and number

Flowing well and number

Municipal or industrial well and number

Spring and number

-300

Shows elevation base of principal sand aquifer in Coker Formation as shown on section A-A'

Contour interval 100 feet; datum is mean sea level.

D — U

Thrust Fault

D, downthrow side, U, upthrow side

Dashed where approximate located

The numbering of wells and springs in Bibb County is based on the Federal system of subdivision of public lands into townships and sections. Each township was assigned a letter, from A in the northeast township through X in the southwest township. Wells and springs within each township are numbered consecutively, and in the report each number is prefixed by the letter identifying the township. For example, wells in township K are identified as K-1, K-2, K-3, etc.

Appendix K

NPDES Permits within the Region of Hydrologic Influence (RHI) for Cahaba River

Source: [EPA] United States Environmental Protection Agency. Undated. Integrated Compliance Information System (ICIS). Accessed 2012. Available from: http://www.epa.gov/compliance/data/systems/icis/

For each NPDES permit in this appendix the corresponding interest type is provided. The table below summarizes each interest type. The discharge limitation parameters are included for each major facility.

Environmental Interest Type	Description
ICIS-NPDES MAJOR	Publicly Owned Treatment Works (POTWs) with design flows ≥1 MGD or serve a population ≥10,000 or cause significant water quality impacts. Non-POTW discharges surpassing a point threshold based on criteria such as toxic pollutant potential, flow volume and water quality factors such as impairment of receiving water or proximity of discharge to coastal waters.
ICIS-NPDES NON-MAJOR	CWA NPDES discharger of pollutants into waters of the U.S. that is not designated as major.
ICIS-NPDES UNPERMITTED	Unpermitted, but discharging pollutants into waters of the U.S. and regulated under the CWA NPDES.
NPDES MAJOR	CWA NPDES major discharger of pollutants into waters of the U.S.
NPDES NON-MAJOR	CWA NPDES non-major discharger of pollutants into waters of the U.S.
N/A	Not Applicable
