Narrative: Burned area was discovered by Wildlife Biologist Becky Rosamond and STEP student Tabitha Beach on December 13, 2005. Based on the regrowth (some grasses had sent up new shoots), they estimated the fire had occurred at least 2 weeks prior to discovery. KBDI values reported were for that time period. The area burned was on either side of a primitive mowed trail, used by staff for 4-wheeler access and closed to the public (though undoubtedly there is some automobile traffic). The fire occurred in a reforestation area with scattered hardwood and pine trees and light grasses underneath. It appeared to have burnt itself out.
