2014 - 2015 Harvest Recommendations:

Antlerless harvest was stable this past season, which is acceptable. The harvest of one doe per 346 acres is less than optimal, but much improved over a doe per 1298 acres in 2008. The doe age structure is sound, with 44% of the antlerless harvest being 3-yrs. old or older. Body weights in the yearling and 2-yr. old age classes were reduced by 10-12 pounds, which is troubling. This is likely related to the severe winter and some late EHD presence. Mature doe body weights were stable, which is logical, since EHD does not have as major of an impact on older deer.

Lactation is problematic in adult doe age classes, but this is likely a function of voluntary data collection by the public. It would be a sound decision to provide more firearm opportunity in order to increase antlerless harvest. Harvest should be increased to a doe per 175 – 200 acres or 78 – 89 does, but this may not be feasible. Therefore, at least try to encourage hunters to maintain the current harvest of one doe/318 acres or about **45 – 55 does**.

Buck harvest was sound with 68% of harvested bucks being 3-years old or older, which is great for public land. Antler dimensions for most of these bucks averaged close to the recommended antler criteria of 15 or 18, but the 3-yr. olds averaged well below these dimensions. This is related to a small sample size of ten bucks, which allowed a couple of abnormally small bucks to have a major influence on the average. Historically, 3-yr. olds have had antlers that easily met these criteria on average. I have recommended implementation of buck harvest criteria requiring a minimum 15 inch inside spread or a minimum 18 inch main beam length to reduce confusion within the Delta, because all State owned WMAs in this region have implemented the same criteria. Also, this will recruit more bucks into older age classes and will reduce rut stress, improve breeding success, and facilitate the harvest of an older, larger animal.
