U. S. FISH AND WILDLIFE SERVICE
SPECIES ASSESSMENT AND LISTING PRIORITY ASSIGNMENT FORM

SCIENTIFIC NAME: *Palaemonella burnsi*

COMMON NAME: Anchialine pool shrimp

LEAD REGION: Region 1

INFORMATION CURRENT AS OF: September 2005

STATUS/ACTION:

____ Species assessment - determined species did not meet the definition of endangered or threatened under the Act and, therefore, was not elevated to Candidate status

____ New candidate

__X_ Continuing candidate

____ Non-petitioned

__X_ Petitioned - Date petition received: May 11, 2004

____ 90-day positive - FR date:

_X__ 12-month warranted but precluded - FR date: May 11, 2005

_N__ Did the petition request a reclassification of a listed species?

FOR PETITIONED CANDIDATE SPECIES:

a. Is listing warranted (if yes, see summary of threats below)? yes

b. To date, has publication of a proposal to list been precluded by other higher priority listing actions? yes

c. If the answer to a. and b. is "yes", provide an explanation of why the action is precluded. We find that the immediate issuance of a proposed rule and timely promulgation of a final rule for this species has been, for the preceding 12 months, and continues to be, precluded by higher priority listing actions. During the past 12 months, most of our national listing budget has been consumed by work on various listing actions to comply with court orders and court-approved settlement agreements, meeting statutory deadlines for petition findings or listing determinations, emergency listing evaluations and determinations and essential litigation-related, administrative, and program management tasks. We will continue to monitor the status of this species as new information becomes available. This review will determine if a change in status is warranted, including the need to make prompt use of emergency listing procedures. For information on listing actions taken over the past 12 months, see the discussion of "Progress on Revising the Lists," in the current CNOR which can be viewed on our Internet website (http://endangered.fws.gov).

__X__ Listing priority change

Former LP: __2__

New LP: __5__

Date when the species first became a Candidate (as currently defined): 10/25/1999

____ Candidate removal: Former LP: ____

___ A – Taxon is more abundant or widespread than previously believed or not subject to the degree of threats sufficient to warrant issuance of a proposed listing or continuance of candidate status.

___U – Taxon not subject to the degree of threats sufficient to warrant issuance of a proposed listing or continuance of candidate status due, in part or totally, to conservation efforts that remove or reduce the threats to the species.

___ F – Range is no longer a U.S. territory.

___ I – Insufficient information exists on biological vulnerability and threats to support listing.

___ M – Taxon mistakenly included in past notice of review.

___ N – Taxon does not meet the Act's definition of "species."

___ X – Taxon believed to be extinct.

ANIMAL/PLANT GROUP AND FAMILY: Crustaceans; Family Palaemonidae (anchialine pool shrimp)

HISTORICAL STATES/TERRITORIES/COUNTRIES OF OCCURRENCE: Hawaii, islands of Maui and Hawaii.

CURRENT STATES/COUNTIES/TERRITORIES/COUNTRIES OF OCCURRENCE: Hawaii, islands of Maui and Hawaii.

LAND OWNERSHIP

The three known Maui pool groups containing *Palaemonella burnsi* are located on State land within the Ahihi-Kinau Natural Area Reserve, and the one known pool group on Hawaii Island is on Federal property, in the Kaloko-Honokohau National Historic Park.

LEAD REGION CONTACT: Paul Phifer (503) 872-2823, paul_phifer@fws.gov

LEAD FIELD OFFICE CONTACT: Pacific Islands Fish & Wildlife Office, Lorena Wada (808) 792-9400, lorena_wada@fws.gov

BIOLOGICAL INFORMATION:

Species Description: Carapace length of *Palaemonella burnsi* (Holthuis 1973) is reported from 6-9 millimeters (0.2-0.3 inches) in length. They are transparent, greyish-green to red, the body being somewhat transparent with coloration dependent on chromatophore (pigment cells) expansion/contraction. There is often a transverse, median pale band across the carapace arranged of white chromatophores. The conspicuous, elongate chelapeds (claws) typically are greyish-green. Black pigments are associated with the well developed eyes. It is likely the shrimp are omnivorous and feed upon algae and detritus. Collected females have been found to

carry numerous, small eggs on the ventral abdomen (Holthuis 1973).

Taxonomy: *Palaemonella burnsi* was described as a new species by Holthuis in 1973. The US Department of Agriculture's Integrated Taxonomic Information Systems online database considers the taxonomy of this species to be valid and this species is recognized as a valid taxon in MacLauglin *et al*. (2005).

Habitat: *Palaemonella burnsi* is known to occur from high-salinity (24-27 parts per thousandth (ppt)) anchialine pools. Anchialine pools are land-locked bodies of water that occur coastally but are not openly connected to the ocean (Macioleck 1983). They are mixohaline, with salinities typically ranging from 2 ppt to concentrations just below that of sea water (32 ppt), although there are pools recorded as having salinities as high as 41 ppt (Macioleck 1983; Brock *et al*. 1987). Anchialine pools are subject to tidal fluctuations. Except for some records of endemic eels, anchialine pools in Hawaii do not support native species of fish although some species of nonnative fish have been introduced and are currently recognized as problems (see Disease and Predation section below) **(**Bailey-Brock and Brock 1993; Brock 2004**).** Although anchialine pools are widespread, being found in areas such as Saudi Arabia, Madagascar, Fiji, and other Indo-Pacific islands, the total area occupied by them globally is extremely small (Maciolek 1983). While a number of species of anchialine shrimp (e.g., *Calliasmata pholidota*) have disjunct, global distributions within these habitats, most geographic locations contain some endemic taxa (Maciolek 1983). Currently in the state of Hawaii, there are estimated to be over 650 anchialine pools, approximately 90 percent of which occur on the island of Hawaii. Of the approximately 585 anchialine pools found on the island of Hawaii, only one pool contains this species and on the island of Maui, this species is found at three sites (Holthuis 1973; Maciolek 1983; Hawaii Biodiversity and Mapping Program database 2004).

Historic and Current Range/Distribution: *Palaemonella burnsi* currently occurs in anchialine pools on the Hawaiian islands of Maui (three sites in the State Ahihi-Kinau Natural Area Reserve (NAR)) and Hawaii (one site in the Kaloko-Honokohau National Historic Park) (Brock 2004; Hawaii Biodiversity and Mapping Program database 2004). Like other anchialine pool shrimp species, this species inhabits an extensive network of water-filled interstitial spaces (cracks and crevices) leading to and from the actual pool, and this trait has precluded researchers from obtaining more accurate population size estimates during surveys for the species (Holthuis 1973; Maciolek 1983). Many of the rare species of anchialine shrimp, including *Palaemonella burnsi*, have merely been noted as present or absent from pools that have been surveyed (often with the aid of baiting). Loss of shrimp species from suitable habitat is likely the best, or only, measure of species decline since population sizes are not easily determined (Holthuis 1973; Maciolek 1983).

THREATS:

A. The present or threatened destruction, modification, or curtailment of its habitat or range. On the island of Hawaii, Dr. Richard Brock (pers. comms. 1998, 2004) estimates that up to 90 percent of the anchialine pools have been destroyed or altered by human activities. The more

recent human modifications of anchialine pools include the bulldozing and filling of pools (Bailey-Brock and Brock 1993). Dumping of refuse and the introduction of nonnative fish (see Disease and Predation section below) has impacted other anchialine pools on this island (R. Brock, *in litt*. 1985; Brock 2004).

The three known Maui pools that contain *Palaemonella burnsi*, were modified by early Hawaiians and later inhabitants of the area, but are within Ahihi-Kinau NAR. Dumping does occur in the Maui NAR, and while none has yet occurred within the pools, this threat remains a possibility (Brock 2004).

Damage from use of anchialine pools for swimming and bathing has been documented in the Hawaiian Islands (R. Brock, *in litt*. 1985; Brock 2004). Similar impacts to the anchialine pools on the island of Hawaii are possible but have not, at present, been documented. Swimming and bathing is not believed to be a serious problem in the Maui pools where *Palaemonella burnsi* is reported to occur.

B. Over-utilization for commercial, recreational, scientific, or educational purposes.
The U.S. Fish and Wildlife Service (Service) has become aware of companies and private collectors using anchialine pool shrimp and related shrimp species for self-contained aquariums similar to those marketed by Ecosphere Associates, Inc. (www.eco-sphere.com 2004). One company located in Hawaii, Fuku Bonsai, has already begun using Hawaiian anchialine pool species for the aquarium hobby market (www.fukubonsai.com 2004). For commercial purposes, currently only a State Commercial Marine License is required to collect anchialine pool shrimp. Collection is prohibited from State Natural Area Reserves and National Historic Parks.

C. Disease or predation.
In Hawaii, predation by introduced nonnative fish is considered to be the greatest threat to native shrimp within anchialine pool ecosystems (Bailey-Brock and Brock 1993; Brock 2004). Marine fish are occasionally seen in isolated pools, indicating that people are introducing these fish into the pools (Bill Evanson, Hawaii Department of Land and Natural Resources, pers. comm. 1998). Anchialine pools have been used to discard or hold bait-fish and/or aquarium fish (Bailey-Brock and Brock 1993). These fish either directly consume the native shrimp or, as with introduced tilapia (*Oreochromis mossambica*), out-compete the native herbivorous species of shrimp that typically serve as the prey-base for the rarer, predatory species of shrimp. Introduction of nonnative fish including bait-fish into such pools may have been a major contributor to the decline of these shrimp. No alien fish species were seen during the most recent survey of the pools where these shrimp occur (Brock 2004).

Invasion, with human assistance, of anchialine pools by nonnative fish is a potential threat and is the most significant impact to pool shrimp and their habitat. Within the State NARs, disturbance of the pools is prohibited and informative signs have been placed at the sites. However, there are concerns that this may not be adequate protection. For example, since 1985 signage was used to keep people from entering the Waikoloa Achialine Pond Preserve at Waikoloa, North Kona, Hawaii. Visitors were not allowed into the pool preserve but could walk around the perimeter.

In December of 2003, it was discovered that someone had released tilapia and mosquito fish into the system. Within six months time, alien fish had invaded two thirds of the system and all the anchialine pool shrimp disappeared (Brock 2004).

D. The inadequacy of existing regulatory mechanisms.
Although there are no existing regulatory mechanisms that specifically protect this species, the three Maui pools are located within the Ahihi-Kinau State NAR. This designation specifically prohibits the removal of any native organism and the disturbance of pools (Administrative Rules, Sec. 13-209-4 (www.dofaw.net/nars 2004)). The State NARs were created to preserve and protect samples of Hawaiian biological ecosystems and geological formations; and are actively managed and monitored for their unique ecosystems. Though signs are posted that provide notice to the public that the pools are off-limits to bathers and other activities that could damage the pools, the State's NARs have no funding for proper enforcement to stop such activity.

E. Other natural or manmade factors affecting its continued existence.
Even if the threats responsible for the decline of this species were controlled, the persistence of existing populations is hampered by the small number of extant populations and the small geographic range of the known populations. This circumstance makes the species more vulnerable to extinction due to a variety of natural processes. Small populations are particularly vulnerable to reduced reproductive vigor caused by inbreeding depression, and they may suffer a loss of genetic variability over time due to random genetic drift, resulting in decreased evolutionary potential and ability to cope with environmental change (Lande 1988; Center for Conservation Update 1994). Small populations are also demographically vulnerable to extinction caused by random fluctuations in population size and sex ratio (Lande 1988).

There are no conservation efforts being taken to alleviate these threats for this species.

CONSERVATION MEASURES PLANNED OR IMPLEMENTED
On the island of Hawaii, *Palaemonella burnsi* occurs in one pool group within the Kaloko-Honokohau National Historic Park and it is prohibited to collect the species or disturb the pool.

On Maui, three of the known pool groups containing *Palaemonella burnsi* lie within the Ahihi-Kinau State Natural Area Reserve. Ahihi-Kinau was the first NAR to be established by the State of Hawaii, and in fact, the presence of the anchialine pools and their rare resident shrimp species was a key reason this area received this designation (Holthuis 1973). This species and the three other candidate anchialine pool shrimp species found within this NAR receive some protection under the state statutes that specifically prohibit the disturbance or removal of any plant or wildlife and the disturbance of any pond or lake.

SUMMARY OF THREATS: The primary threats to this species are the loss of habitat due to degradation and predation from nonnative fish. Currently, the species only occurs in four remaining pool groups. Three groups of pools are located in a Ahihi-Kinau NAR on Maui and one pool group is located on the island of Hawaii in a National Historic Park. Both the NAR and the Park prohibit the collection of the species and the disturbance of the pools. However,

enforcement of these prohibitions is difficult and the negative effects from the introduction of nonnative fish are extensive and happen quickly.

SUMMARY OF REASONS FOR ADDITION, REMOVAL OR LISTING PRIORITY CHANGE:

The listing priority number is being changed from 2 to 5 because no nonnative fish were observed during surveys conducted for this shrimp in 2004. Therefore, the threat of predation from nonnative fish is non-imminent since it is not currently occurring. In addition, threats to this shrimp form habitat degradation and destruction due to dumping, fill, bulldozing, swimming, and bathing are also non-imminent.

LISTING PRIORITY:

THREAT			
Magnitude	Immediacy	Taxonomy	Priority
High	Imminent	Monotypic genus	1
		Species	2
		Subspecies/population	3
	Non-imminent	Monotypic genus	4
		Species	**5***
		Subspecies/population	6
Moderate to Low	Imminent	Monotypic genus	7
		Species	8
		Subspecies/population	9
	Non-imminent	Monotypic genus	10
		Species	11
		Subspecies/population	12

Rationale for listing priority number:

Magnitude:

This species is highly threatened throughout its limited range by the potential introduction of nonnative fish (often with human assistance), the single greatest threat to anchialine pool shrimp and their habitat. Modification or loss of the anchialine pool habitat by dumping or fill, or from recreational activities is another potential threat. Lastly, collection of *Palaemonella burnsi* for sale or trade is also a potential threat to this species.

Imminence:

Threats to *Palaemonella burnsi* from nonnative fish, dumping, fill, recreational activities, and overcollection are non-imminent because they are not on-going. Nonnative fish are not present in the pools in which *Palaemonella burnsi* currently occurs.

Yes Have you promptly reviewed all of the information received regarding the species for the purpose of determining whether emergency listing is needed?

Is Emergency Listing Warranted?

No. *Palaemonella burnsi* is currently known from four populations, three of which are located within the Ahihi-Kinau State Natural Area Reserve and one in a National Historic Park. State statutes may provide some protection to the Maui population. The species does not appear to be appropriate for emergency listing at this time because the immediacy of the threats is not so great as to imperil a significant proportion of the species' total populations within the time frame of the routine listing process. If it becomes apparent that the routine listing process is not sufficient to prevent large losses that may result in this species' extinction, then the emergency rule process for this species will be initiated. We will continue to monitor the status of *Palaemonella burnsi* as new information becomes available. This review will determine if a change in status is warranted, including the need to make prompt use of emergency listing procedures.

DESCRIPTION OF MONITORING

We conducted literature searches for recent articles on this species and contacted relevant species experts, U.S. Geological Survey-Biological Resources Discipline, State officials with the Department of Land and Natural Resources, Bishop Museum, University of Hawaii, and Auburn University researchers regarding the current status of this species. Additional information on the species' status was added incorporated into this assessment and the existing data regarding the species' status was verified.

This level of monitoring is appropriate to update this status of the species because a thorough literature search was conducted as well as relevant species experts contacted. Information contained in this assessment form was verified by species experts and any new information incorporated. The Hawaii Biodiversity and Mapping Program lists this species as critically imperiled (Hawaii Biodiversity and Mapping Program database 2004). This species is not listed in the International Union for Conservation of Nature and Natural Resources Red Data List database (International Union for Conservation of Nature and Natural Resources database 2004).

COORDINATION WITH STATES:

In October 2004 we provided the Division of Forestry and Wildlife Administrator, Paul Conry, with copies of our most recent candidate assessment forms for his review and comment. In addition, copies of the candidate forms were sent to Betsy Gagne, Executive Secretary for the Hawaii Natural Area Reserves System Commission. Ms. Gagne reviewed the information for this species and provided no additional information or corrections (B. Gagne, pers. comm. 2005).
